Elixir creator Jose Valim and award winning author Bruce Tate walk you through building an application that's fast and reliable. At every step you'll learn from the Phoenix creators not just what to do but why. Packed with insider insights, this definitive guide will be your constant companion in your journey from Phoenix novice to expert as you build the next generation of web applications. Phoenix is the long-awaited web framework based on Elixir, the highly concurrent language that combines a beautiful syntax with rich metaprogramming. The authors, who developed the earliest production Phoenix applications, will show you how to create code that's easier to write, test, understand, and maintain. The best way to learn Phoenix is to code, and you'll get to attack some interesting problems. Start working with controllers, views, and templates within the first few pages. Build an in-memory repository and then back it with an Ecto database layer. Learn to use change sets and constraints that keep readers informed and your database integrity intact. Craft your own interactive application based on the Channels API for the real-time, high-performance applications that this ecosystem made famous. Write your own authentication components called plugs and even learn to use the OTP layer for monitored, reliable services. Organize your code with umbrella projects so you can keep your applications modular and easy to maintain. This is a book by developers and for developers, and we know how to help you ramp up quickly. Any book can tell you what to do. When you've finished this one, you'll also know why to do it. What You Need To work through this book, you will need a computer capable of running Erlang 17 or better, Elixir 1.1 or better, Phoenix 1.0 or better, and Ecto 1.0 or better. Anomaly Detection in Video Surveillance Xiaochun Wang, 2024-08-06. Anomaly detection in video surveillance stands at the core of numerous real-world applications that have broad impact and generate significant academic and industrial value. The key advantage of writing the book at this point in time is that the vast amount of work done by computer scientists over the last few decades has remained largely untouched by a formal book on the subject, although these techniques significantly advance existing methods of image and video analysis and understanding by taking advantage of anomaly detection in the data mining community and visual analysis in the computer vision community. The proposed book provides a comprehensive coverage of the advances in video-based anomaly detection, including topics such as the theories of anomaly detection and machine perception for the functional analysis of abnormal events in general, the identification of abnormal behaviour and crowd abnormal behaviour in particular, the current understanding of computer vision development and the application of this present understanding towards improving video-based anomaly detection in theory and coding with OpenCV. The book also provides a perspective on deep learning on human action recognition and behaviour analysis, laying the groundwork for future advances in these areas. Overall, the chapters of this book have been carefully organized with extensive bibliographic notes attached to each chapter. One of the goals is to provide the first systematic and comprehensive description of the range of data-driven solutions currently being developed up to date for such purposes. Another is to serve a dual purpose so that students and practitioners can use it as a textbook while researchers can

use it as a reference book A final goal is to provide a comprehensive exposition of the topic of anomaly detection in video media from multiple points of view *Image and Video Retrieval* Peter Enser,Yiannis Kompatsiaris,Noel E. O'Connor,Alan Smeaton,Arnold W.M. Smeulders,2004-06-25 This book constitutes the refereed proceedings of the Third International Conference on Image and Video Retrieval CIVR 2004 held in Dublin Ireland in July 2004 The 31 revised full papers and 44 poster papers presented were carefully reviewed and selected from 125 submissions The papers are organized in topical sections on image annotation and user searching image and video retrieval algorithms person and event identification for retrieval content based image and video retrieval and user perspectives **Journal of VLSI Signal Processing Systems for Signal, Image, and Video Technology** ,1999 *Using Additional Information in Streaming Algorithms* Raffael Buff,2016-10-04 Streaming problems are algorithmic problems that are mainly characterized by their massive input streams Because of these data streams the algorithms for these problems are forced to be space efficient as the input stream length generally exceeds the available storage In this thesis the two streaming problems most frequent item and number of distinct items are studied in detail relating to their algorithmic complexities and it is compared whether the verification of solution hypotheses has lower algorithmic complexity than computing a solution from the data stream For this analysis we introduce some concepts to prove space complexity lower bounds for an approximative setting and for hypothesis verification For the most frequent item problem which consists in identifying the item which has the highest occurrence within the data stream we can prove a linear space complexity lower bound for the deterministic and probabilistic setting This implies that in practice this streaming problem cannot be solved in a satisfactory way since every algorithm has to exceed any reasonable storage limit For some settings the upper and lower bounds are almost tight which implies that we have designed an almost optimal algorithm Even for small approximation ratios we can prove a linear lower bound but not for larger ones Nevertheless we are not able to design an algorithm that solves the most frequent item problem space efficiently for large approximation ratios Furthermore if we want to verify whether a hypothesis of the highest frequency count is true or not we get exactly the same space complexity lower bounds which leads to the conclusion that we are likely not able to profit from a stated hypothesis The number of distinct items problem counts all different elements of the input stream If we want to solve this problem exactly in a deterministic or probabilistic setting or approximately with a deterministic algorithm we require once again linear storage size which is tight to the upper bound However for the approximative and probabilistic setting we can enhance an already known space efficient algorithm such that it is usable for arbitrarily small approximation ratios and arbitrarily good success probabilities The hypothesis verification leads once again to the same lower bounds However there are some streaming problems that are able to profit from additional information such as hypotheses as e g the median problem [OpenMAX AL 1.1 Quick Reference](#) Khronos Group, **Mastering Moodle: A Comprehensive Guide to Learning Management** Dr Balasubramanian Thiagarajan,2024-05-01 Mastering Moodle A Comprehensive Guide to

Indexing and Representation is on content based multimedia analysis indexing representation and applications with a focus on feature films Presented are the state of art techniques in video content analysis domain as well as many novel ideas and algorithms for movie content analysis based on the use of multimodal information The authors employ multiple media cues such as audio visual and face information to bridge the gap between low level audiovisual features and high level video semantics Based on sophisticated audio and visual content processing such as video segmentation and audio classification the original video is re represented in the form of a set of semantic video scenes or events where an event is further classified as a 2 speaker dialog a multiple speaker dialog or a hybrid event Moreover desired speakers are simultaneously identified from the video stream based on either a supervised or an adaptive speaker identification scheme All this information is then integrated together to build the video s ToC table of content as well as the index table Finally a video abstraction system which can generate either a scene based summary or an event based skim is presented by exploiting the knowledge of both video semantics and video production rules This monograph will be of great interest to research scientists and graduate level students working in the area of content based multimedia analysis indexing representation and applications as well s its related fields
