GPU Parallel Program Development Using CUDA Tolga Soyata, 2018-01-19 GPU Parallel Program Development using CUDA teaches GPU programming by showing the differences among different families of GPUs. This approach prepares the reader for the next generation and future generations of GPUs. The book emphasizes concepts that will remain relevant for a long time rather than concepts that are platform specific. At the same time the book also provides platform dependent explanations that are as valuable as generalized GPU concepts. The book consists of three separate parts. It starts by explaining parallelism using CPU multi threading in Part I. A few simple programs are used to demonstrate the concept of dividing a large task into multiple parallel sub tasks and mapping them to CPU threads. Multiple ways of parallelizing the same task are analyzed and their pros cons are studied in terms of both core and memory operation. Part II of the book introduces GPU massive parallelism. The same programs are parallelized on multiple Nvidia GPU platforms and the same performance analysis is repeated. Because the core and memory structures of CPUs and GPUs are different the results differ in interesting ways. The end goal is to make programmers aware of all the good ideas as well as the bad ideas so readers can apply the good ideas and avoid the bad ideas in their own programs. Part III of the book provides pointer for readers who want to expand their horizons. It provides a brief introduction to popular CUDA libraries such as cuBLAS, cuFFT, NPP and Thrust, the OpenCL programming language, an overview of GPU programming using other programming languages and API libraries such as Python, OpenCV, OpenGL and Apple's Swift and Metal and the deep learning library cuDNN.

Computational Physics Rubin H. Landau, Manuel J. Páez, Cristian C. Bordeianu, 2015-09-08 The use of computation and simulation has become an essential part of the scientific process. Being able to transform a theory into an algorithm requires significant theoretical insight, detailed physical and mathematical understanding and a working level of competency in programming. This upper division text provides an unusually broad survey of the topics of modern computational physics from a multidisciplinary computational science point of view. Its philosophy is rooted in learning by doing, assisted by many model programs with new scientific materials as well as with the Python programming language. Python has become very popular particularly for physics education and large scientific projects. It is probably the easiest programming language to learn for beginners yet is also used for mainstream scientific computing and has packages for excellent graphics and even symbolic manipulations. The text is designed for an upper level undergraduate or beginning graduate course and provides the reader with the essential knowledge to understand computational tools and mathematical methods well enough to be successful. As part of the teaching of using computers to solve scientific problems, the reader is encouraged to work through a sample problem stated at the beginning of each chapter or unit which involves studying the text, writing, debugging and running programs, visualizing the results and the expressing in words what has been done and what can be concluded. Then there are exercises and problems at the end of each chapter for the reader to work on their own with model programs given for that.

5th International Conference on Practical Applications of Computational Biology & Bioinformatics Miguel P. Rocha,Juan Manuel Corchado Rodríguez,Florentino Fdez Riverola,Alfonso Valencia,2011-03-09 The growth in the Bioinformatics and Computational Biology fields over the last few years has been remarkable and the trend is to increase its pace In fact the need for computational techniques that can efficiently handle the huge amounts of data produced by the new experimental techniques in Biology is still increasing driven by new advances in Next Generation Sequencing several types of the so called omics data and image acquisition just to name a few The analysis of the datasets that produces and its integration call for new algorithms and approaches from fields such as Databases Statistics Data Mining Machine Learning Optimization Computer Science and Artificial Intelligence Within this scenario of increasing data availability Systems Biology

has also been emerging as an alternative to the reductionist view that dominated biological research in the last decades. Indeed, Biology is more and more a science of information requiring tools from the computational sciences. In the last few years, we have seen the surge of a new generation of interdisciplinary scientists that have a strong background in the biological and computational sciences. In this context, the interaction of researchers from different scientific fields is more than ever of foremost importance, boosting the research efforts in the field and contributing to the education of a new generation of Bioinformatics scientists. PACBB 11 hopes to contribute to this effort, promoting this fruitful interaction. PACBB 11 technical program included 50 papers from a submission pool of 78 papers spanning many different sub-fields in Bioinformatics and Computational Biology. Therefore, the conference will certainly have promoted the interaction of scientists from diverse research groups and with a distinct background: computer scientists, mathematicians, biologists. The scientific content will certainly be challenging and will promote the improvement of the work that is being developed by each of the participants.
