Using the Economic Surplus Model to Measure Potential Returns to International Livestock Research Patricia Kristjanson, 1999-01-01 This study has developed a methodology that builds on the approach to measuring agricultural research returns suggested by Alston et al 1995 We have integrated a herd model to measure the potential size of impact of a new technology GIS to predict where this impacts is likely to be felt and the economic surplus model to estimate some of the costs of trypanosomosis the potential benefits of controlling it and potential returns to vaccine research The advantage of this approach is that it uses field data and GIS analysis to determine where and how much impact research will have on livestock productivity rather than guesstimates by researchers as has often been done in previous studies of returns to agricultural research It is an approach however that requires much data and the type of information that is still scarce in many developing countries This includes evidence of the productivity impacts of a given livestock technology at the herd rather than individual animal level and access to GIS data at the lowest administrative level possible e g district Ideally household level survey data are used to complement the GIS data and verify the recommendation domain Thus this approach will be enhanced in future analyses by the availability of a wider range of data collected at the household level from different livestock production systems to examine more closely the question Impact on whom
