Performance and Implementation Aspects of Nonlinear Filtering Gustaf Hendeby, 2008-02-15 Nonlinear filtering is an important standard tool for information and sensor fusion applications e g localization navigation and tracking It is an essential

component in surveillance systems and of increasing importance for standard consumer products such as cellular phones with localization car navigation systems and augmented reality This thesis addresses several issues related to nonlinear filtering including performance analysis of filtering and detection algorithm analysis and various implementation details The most commonly used measure of filtering performance is the root mean square error RMSE which is bounded from below by the Cram r Rao lower bound CRLB This thesis presents a methodology to determine the effect different noise distributions have on the CRLB This leads up to an analysis of the intrinsic accuracy IA the informativeness of a noise distribution For linear systems the resulting expressions are direct and can be used to determine whether a problem is feasible or not and to indicate the efficacy of nonlinear methods such as the particle filter PF A similar analysis is used for change detection performance analysis which once again shows the importance of IA A problem with the RMSE evaluation is that it captures only one aspect of the resulting estimate and the distribution of the estimates can differ substantially To solve this problem the Kullback divergence has been evaluated demonstrating the shortcomings of pure RMSE evaluation Two estimation algorithms have been analyzed in more detail the Rao Blackwellized particle filter RBPF by some authors referred to as the marginalized particle filter MPF and the unscented Kalman filter UKF The RBPF analysis leads to a new way of presenting the algorithm thereby making it easier to implement In addition the presentation can possibly give new intuition for the RBPF as being a stochastic Kalman filter bank In the analysis of the UKF the focus is on the unscented transform UT The results include several simulation studies and a comparison with the Gauss approximation of the first and second order in the limit case This thesis presents an implementation of a parallelized PF and outlines an object oriented framework for filtering The PF has been implemented on a graphics processing unit GPU i e a graphics card The GPU is a inexpensive parallel computational resource available with most modern computers and is rarely used to its full potential Being able to implement the PF in parallel makes new applications where speed and good performance are important possible The object oriented filtering framework provides the flexibility and performance needed for large scale Monte Carlo simulations using modern software design methodology It can also be used to help to efficiently turn a prototype into a finished product

GPU Parallel Program Development Using CUDA Tolga Soyata,2018-01-19 GPU Parallel Program Development using CUDA teaches GPU programming by showing the differences among different families of GPUs This approach prepares the reader for the next generation and future generations of GPUs The book emphasizes concepts that will remain relevant for a long time rather than concepts that are platform specific At the same time the book also provides platform dependent explanations that are as valuable as generalized GPU concepts The book consists of three separate parts it starts by explaining parallelism using CPU multi threading in Part I A few simple programs are used to demonstrate the concept of dividing a large task into multiple parallel sub tasks and mapping them to CPU threads Multiple ways of parallelizing the same task are analyzed and their pros cons are studied in terms of both core and memory operation Part II of the book introduces GPU massive parallelism The same programs are parallelized on multiple Nvidia GPU platforms and the same performance analysis is repeated Because the core and memory structures of CPUs and GPUs are different the results differ in interesting ways The end goal is to make programmers aware of all the good ideas as well as the bad ideas so readers can apply the good ideas and avoid the bad ideas in their own programs Part III of the book provides pointer for readers who want to expand their horizons It provides a brief introduction to popular CUDA libraries such as cuBLAS cuFFT NPP and Thrust the OpenCL programming language an overview of GPU programming using other programming languages and API libraries such as Python OpenCV OpenGL and Apple s Swift and Metal and the deep learning library cuDNN
