Data for Assessing Process Control and Product Acceptance is written by the International Commission on Microbiological Specifications for Foods with assistance from a limited number of consultants. The purpose of this book is to provide guidance on appropriate testing of food processing environments, processing lines and finished product to enhance the safety and microbiological quality of the food supply. *Microorganisms in Foods 8* consists of two parts. Part I, *Principles of Using Data in Microbial Control*, builds on the principles of *Microorganisms in Foods 7*. *Microbiological Testing in Food Safety Management 2002* which illustrates how HACCP and Good Hygienic Practices (GHP) provide greater assurance of safety than microbiological testing but also identifies circumstances where microbiological testing may play a useful role. Part II, *Specific Applications to Commodities*, provides practical examples of criteria and other tests and is an updated and expanded version of Part II of *Microorganisms in Foods 2*. *Sampling for Microbiological Analysis: Principles and Specific Applications*, 2nd ed, 1986. Part II also builds on the 2nd edition of *Microorganisms in Foods 6*. *Microbial Ecology of Food Commodities 2005* by identifying appropriate tests to evaluate the effectiveness of controls. *Food Safety Management* Y. Motarjemi, G.G. Moy, P.J. Jooste, L.E. Anelich, 2013-11-01. In many countries of the world the dairy industry is one of the most important food sectors and it has by and large been very successful in providing safe products. Nevertheless the dairy sector like other food sectors also has its challenges as from farm to the point of consumption dairy products can become contaminated with a broad range of microbial and chemical hazards. The sources of contamination are multiple and the pathways are complex. Contamination of milk can occur directly by dairy animals shedding pathogens into the milk or indirectly by contamination of the milk during the milking process, collection and transportation. Infected animals or asymptomatic carriers can shed the organisms in the feces and contaminate the milk through the environment. Other sources of environmental contamination are water, pests, soil, feces, pets and contaminated feed. Infected farmers not respecting hand hygiene are also a potential source of contamination of milk. During milking, collection and transportation, milk can be subjected to further contamination by the equipment and/or be subjected to time/temperature abuse creating optimum conditions for microbial growth. Hence ensuring safety of milk and dairy products starts on the farm with animal health, quality of feed, a hygienic environment and in general good animal husbandry. Nevertheless pasteurization of milk is necessary to kill any surviving organisms and reduce the risk of illness to an acceptable level. Provided that hygienic measures are taken to prevent any post-process contamination, milk and dairy products can be produced and consumed safely. The present chapter reviews risks and control measures all along the production chain. **Einführung in die Lebensmittelhygiene** Hans-Jürgen Sinell, 2004. Parey im MVS. Food Safety Management Tim Jackson, 2013-11-01. Microbiological testing programs play an important role in the verification of the effectiveness of control measures for many food products. Such programs may include monitoring of the production environment and processing equipment and testing of raw materials in process and finished products. The relevance and application of testing programs depend upon the design of the product and process, the hygienic status of the processing

environment and the availability of other verification information about a product lot The design and implementation of environmental monitoring programs consider the areas of product exposure and the potential impact of the movement of people materials and product on product contamination Raw material testing programs consider the inherent risk of the material its use in the process and the confidence in the supplier determined by supplier audits and ongoing performance Finished product testing programs consider customer and regulatory requirements and the hygienic status of the process and production environment Due to statistical and temporal limitations microbiological testing programs are most effective when used along with risk based preventive controls such as HACCP hygienic zoning and other prerequisite programs and when they work together with other verification activities to assess the condition of a food safety system *Food Safety Management* John N.
