Störungsumempfindliche Informationsübertragung in dynamischer Produktionsumgebung Michelangelo Masini, 2015-02-12 Durch die stetige Optimierung der Prozesse und Technologien hin

zu einer effizienteren und wandlungsfähigeren Produktion erhöhen sich auch die Anforderungen an die Datenverbindungen was die Wandlungsfähigkeit angeht. Da eine drahtlose Verbindung in der Fertigungsumgebung eine Entwicklung hin zur Wandlungsfähigkeit vereinfachen kann, stellt sich die Herausforderung eine drahtlose Funktechnologie zu finden, mit der eine drahtlose Datenübertragung mit den erhöhten Anforderungen der Fertigungsumgebung realisiert werden kann und diese dann zu evaluieren. Der Anwendungsfall, der hier betrachtet wird, ist die Verwendung der drahtlosen Verbindung als protokollunabhängige drahtlose und transparente Brücke um innerhalb einer Werkzeugmaschine den Feldbus über eine Distanz von bis zu 10 Metern zu überbrücken. Die drahtlose Verbindung wird in softwaredefinierter impulsbasierter Ultrabreitbandtechnik UWB realisiert. Dazu wird das Band von 3,1 GHz bis 10,6 GHz verwendet.

Systeme, Verfahren und Komponenten zur hochauflösenden Dauerstrich-Terahertz-Spektroskopie Thorsten Göbel, 2011-03-31

Durch den langjährigen Mangel an künstlichen Quellen ist der Terahertzbereich des elektromagnetischen Spektrums weit weniger erforscht als die benachbarten Gebiete der Mikrowellentechnik und Optik. Seit wenigen Jahren schließt sich die sogenannte THz-Lücke, die Frequenzen von 300 GHz bis 10 THz umfasst, durch den technologischen Fortschritt jedoch stetig und zeigt eine immense Anzahl von Einsatzgebieten für THz-Strahlung auf. Dazu gehört die zerstörungsfreie Werkstoffprüfung genauso wie biomedizinische Anwendungen oder Sicherheitstechnologien. Optoelektronische Verfahren zur kohärenten Generation und Detektion von THz-Signalen bieten auch ohne den Einsatz kryogener Komponenten Bandbreiten von mehreren Terahertz und sind somit rein elektronischen Ansätzen deutlich überlegen. Auf dem Gebiet der Dauerstrich-THz-Systeme hat sich die sogenannte Photomischung, eine heterodyne Differenzfrequenzerzeugung in schnellen Photohalbleitern, als besonders geeignet herauskristallisiert. Diese Technik vereint große Bandbreite und präzise Frequenzaufstellung mit einem hohen Signal zu Rausch-Verhältnis. In der vorliegenden Dissertation werden Systeme, Verfahren und Komponenten zur hochauflösenden Dauerstrich-THz-Spektroskopie entwickelt. In der Systemtechnik konnte die Frequenz- und die Signalstabilität kohärenter THz-Systeme verbessert werden. Durch den Einsatz einer externen optischen Wellenlängenstabilisierung wurde eine Langzeitstabilität der THz-Frequenz von 50 MHz in 24 h erreicht. Im gleichen Zeitraum konnte eine Amplitudenstabilität von 3% sowie eine Phasenstabilität von 4° erzielt werden. Durch eine modifizierte Systemkonfiguration und ein neuartiges Modulationsverfahren ist es zudem gelungen, die Dauerphasensensitiver THz-Messungen gegenüber bisher bekannten Verfahren um 95% zu reduzieren. Weiterhin werden in dieser Arbeit die Angaben hinsichtlich des Signal zu Rausch-Verhältnisses photokonduktiver THz-Systeme erstmals mit einer Aussage über die Lebensdauer von Photomischern verknüpft. Mit einem für 1000 Betriebsstunden ausgelegten THz-System konnte bei einer Frequenz von 1 THz ein Signal zu Rausch-Verhältnis von 31 dB erreicht werden. Im Bereich der Komponentenentwicklung werden neuartige Subwellenlängen-Resonatoren für den Einsatz in der THz-Spektroskopie optimiert. Der Einfluss von Geometrie und Material auf die spektralen Eigenschaften sowie die Kombinierbarkeit der Resonatoren mit den vorangehend entworfenen THz-Systemen sind Bestandteil der

Untersuchungen Zur schnellen computergestützten Synthese der Subwellenlängen Sensoren wurde zudem ein analytisches Modell entwickelt und durch numerische Simulation verifiziert Die implementierten Strukturen weisen Sensitivitäten auf die um bis zu 25% über den Werten bekannter Resonatorverfahren liegen So konnten Materialien erfolgreich charakterisiert werden deren optische Dicke unter einem hundertstel der Resonanzwellenlänge der Subwellenlängen Sensoren liegt Im dritten und letzten Schwerpunkt dieser Arbeit sind integrierte Dauerstrich THz Systeme entworfen worden die THz Emitter Sensoreinheit und THz Detektor auf einem Halbleitersubstrat vereinen Durch den Einsatz neuer robuster Phasenmodulationsverfahren konnte der nutzbare Frequenzbereich im Dauerstrichbetrieb um einen Faktor 5 verbessert werden Die erreichten Frequenzen von über 1 THz stellen einen internationalen Bestwert dar

ANALOG '05 Wolfgang Mathis, 2005 **Microstrip Antenna** J. R. James, Peter S. Hall, Colin Wood, 1986 In the past few years the concept of creating microwave antennas using microstrip has attracted increasing attention and viable practical designs are now emerging The purpose of this monograph is to present the reader with an appreciation of the underlying physical action up to date theoretical treatments useful antenna design approaches and the overall state of the art situation The emphasis is on antenna engineering design but to achieve this goal it has been

necessary to delve into the behaviour of microstrip in a much wider sense and also include aspects of electromagnetic analysis. As a consequence the monograph will also be of interest to microstrip circuit designers and to some extent those seeking electromagnetic problems of a challenging nature. The astronomical progress in miniaturising and integrating electronic circuits in the past decade has recently created a positive demand for a new generation of antenna systems. In principle microstrip antennas are thin planar configurations that are lightweight, low cost, easy to manufacture and can be made conformal with the surfaces of vehicles, missiles etc. The compatibility of microstrip antennas with integrated electronics is another great advantage. However the microstrip wavetrapping effects inhibit the radiation mechanism and must be taken into account in antenna design. Wave trapping effects in substrates involve the study of surface waves and discontinuities in open waveguide structures. The microstrip antenna designer must therefore encompass many more effects than previously considered by microstrip circuit designers. It is for these reasons that the scope of this monograph is necessarily somewhat wider than the title may suggest. The ten chapters are a blend of introductory practical and theoretical treatments and likely future developments are also highlighted. A good selection of past and current references are given and each chapter concludes with a helpful summary comment.

RF Photonic Technology in Optical Fiber Links William S. C. Chang, 2007-05-14. In many applications radio frequency (RF) signals need to be transmitted and processed without being digitalized. Optical fiber provides a transmission medium in which RF modulated optical carriers can be transmitted and distributed with very low loss, making it more efficient and less costly than conventional electronic systems. This volume presents a review of RF photonic components, transmission systems and signal processing examples in optical fibers from leading academic, government and industry scientists working in this field. It also introduces the reader to various related technologies such as direct modulation of laser sources, external modulation techniques and detectors. The text is aimed at engineers and scientists engaged in the research and development of optical fibers and analog RF applications. With an emphasis on design performance and practical application, this book will be of particular interest to those developing systems based on this technology.

Microwave Systems Design Zaiki Awang, 2013-09-24. The aim of this book is to serve as a design reference for students and as an up to date reference for researchers. It also acts as an excellent introduction for newcomers to the field and offers established RF/microwave engineers a comprehensive refresher. The content is roughly classified into two: the first two chapters provide the necessary fundamentals while the last three chapters focus on design and applications. Chapter 2 covers detailed treatment of transmission lines. The Smith chart is utilized in this chapter as an important tool in the synthesis of matching networks for microwave amplifiers. Chapter 3 contains an exhaustive review of microstrip circuits culled from various references. Chapter 4 offers practical design information on solid state amplifiers while Chapter 5 contains topics on the design of modern planar filters, some of which were seldom published previously. A set of problems at the end of each chapter provides the readers with exercises which are compiled from actual university exam questions. An

extensive list of references is available at the end of each chapter to enable readers to obtain further information on the topics covered
