capitalism centered on the processes of location valuation and marketization to provide a new vantage point from which to better understand and intervene in the dominant techno economic paradigm of our time By centering the spatiality of digital capitalism Alvarez Leon shows how this system is the product not of seemingly intangible information clouds but rather of a vast array of technologies practices and infrastructures deeply rooted in place mediated by geography and open to contestation and change

almost everyone has published his own Ajax framework or library in the last two years In the meantime there are far more than 150 different frameworks for various programming languages and diverse aims Because of this uncontrolled growth of frameworks it is quite difficult to say which of those is most suitable for a specific project There are two key questions that have to be considered in case of Ajax or Rich Internet Applications RIAs in general How can Ajax significantly increase the business value of an application and how can it be applied productively This thesis mainly focuses on the latter question by evaluating three Ajax frameworks of large companies with a strong background by means of an example application with respect to commercial applicability productivity performance as well as enhancement and adaptation possibilities Furthermore this work discusses the technical limitations and problems of Ajax and provides an outlook on future developments in this area As example application for the evaluation a web based tracking system for public transportation is implemented Each single vehicle is visualized on a street map according to its current position By the implementation of this application with each of the three chosen Ajax frameworks their applicability productivity and performance is illustrated as well as
