Generative and Component-Based Software Engineering Krzysztof Czarnecki, Ulrich W. Eisenecker, 2003-06-26 In the past two years the Smalltalk and Java in Industry and Education Conference STJA featured a special track on generative programming which was organized by the working group Generative and Component Based Software Engineering of the Gesellschaft für Informatik FG 2.1.9 Object Oriented Software Engineering. This track covered a wide range of related topics from domain analysis software system family engineering and software product lines to extendible compilers and active libraries. The talks and keynotes directed towards this new software engineering paradigm received much attention and interest from the STJA audience. Hence the STJA organizers suggested enlarging this track making it more visible and open to wider international participation. This is how the GCSE symposium was born. The first GCSE symposium attracted 39 submissions from all over the world. This impressive number demonstrates the international interest in generative programming and related fields. After a careful review by the program committee fifteen papers were selected for presentation. We are very grateful to the members of the program committee all of them renowned experts for their dedication in preparing thorough reviews of the submissions. Special thanks go to Elke Pulvermüller and Andreas Speck who proposed and organized a special conference event the Young Researchers Workshop YRW. This workshop provided a unique opportunity for young scientists and Ph.D.

Essentials of Software Testing Ralf Bierig, Stephen Brown, Edgar Galván, Joe Timoney, Joseph Timoney, 2021-08-19 This accessible introduction demonstrates a range of testing techniques in the context of a single worked example that runs throughout. Students can easily see the strengths and limitations of progressively more complex approaches in theory and practice. Test automation and the process of testing are emphasised.

C: A Software Engineering Approach Peter A. Darnell, Philip E. Margolis, 2012-12-06 This book describes the C programming language and software engineering principles of program construction The book is intended primarily as a textbook for beginning and intermediate C programmers It does not assume previous knowledge of C nor of any high level language though it does assume that the reader has some familiarity with computers While not essential knowledge of another programming language will certainly help in mastering C Although the subject matter of this book is the C language the emphasis is on software engineering making programs readable maintainable portable and efficient One of our main goals is to impress upon readers that there is a huge difference between programs that merely work and programs that are well engineered just as there is a huge difference between a log thrown over a river and a well engineered bridge The book is organized linearly so that each chapter builds on information provided in the previous chapters Consequently the book will be most effective if chapters are read sequentially Readers with some experience in C however may find it more useful to consult the table of contents and index to find sections of particular interest
