Toranzos, 2024-11-01 From the Preface Antibody techniques have allowed us to study microorganisms in situ However until recently all methodology lacked the sensitivity necessary for environmental work where microorganisms are in most cases present at very low concentrations or where microbial ecosystems contain a myriad of different organisms Gene probes have been used successfully for a variety of samples but this method was still not sensitive enough The next logical step was the application of the recently developed DNA amplification technique known as the polymerase chain reaction or PCR Since then many laboratories around the world have adopted PCR for environmental work Samples obtained from soils water and air are enormously complex because they are unknown mixtures of DNA and other compounds Thus procedures for target DNA amplification from the environment require special attention The PCR has allowed us to go beyond the need for culturing prior to analysis of microbial communities It has been shown that even microorganisms that can be routinely grown in the laboratory undergo some physiological changes when exposed to the environment One of these changes first observed by R Colwell and colleagues is known as the viable but non culturable state and seems to be a common occurrence Thus the use of culture techniques paint only part of the picture in terms of microbial behavior under environmental conditions The

ability to amplify nucleic acids by the PCR has brought about a myriad of very ingenious modifications to the technique that can then be used to study complex ecosystems. The manner in which the PCR can be modified is only limited by the need and or the imagination of the researcher. The first manual dedicated specifically to the analysis by PCR of environmental samples *Environmental Applications of Nucleic Acid Amplification Techniques* presents state of the art methodology for the detection of microorganisms in soil water air samples as well as the amplification of nucleic acids from fossil samples. The manual gives step by step procedures for the analysis of these samples. Although several publications have addressed the use of Polymerase Chain Reaction technique very few of them have been directed toward the application of this technique to environmental samples. This book fills this gap in the literature. *Point-of-care diagnostics technology and applications* Nongyue He,Guangli Li,Zhiyang Li,Hongna Liu,Song Li,Yanqi Wu,2023-08-16 [Nucleic Acid Amplification Strategies for Biosensing, Bioimaging and Biomedicine](#) Shusheng Zhang,Sai Bi,Xinyue Song,2019-04-25 This book describes the rational design development and application of nucleic acid amplification strategies for biosensing bioimaging and biomedicine. It consists of fifteen chapters demonstrating the use of these strategies in various areas including fluorescence techniques Chemiluminescence biosensors electrochemiluminescence biosensors colorimetric assays surface plasmon resonance technologies electrochemical DNA sensors photoelectrochemical biosensor nanopore sensors quartz crystal microbalance fluorescence imaging surface enhanced Raman spectroscopy in vitro and in vivo metal ions detection theranostics and microdroplet chips. Offering a collection of reviews illustrating the latest advances in biochemical analysis and therapeutics the book shares valuable insights into current challenges and future prospects making it a valuable resource for a wide readership in the various fields of biosensing bioimaging and biomedicine.
