Zhu,2004-02-19 A hands on troubleshooting guide for VLSI network designers The primary goal in VLSI very large scale integration power network design is to provide enough power lines across a chip to reduce voltage drops from the power pads to the center of the chip Voltage drops caused by the power network s metal lines coupled with transistor switching currents on the chip cause power supply noises that can affect circuit timing and performance thus

providing a constant challenge for designers of high performance chips Power Distribution Network Design for VLSI provides detailed information on this critical component of circuit design and physical integration for high speed chips A vital tool for professional engineers especially those involved in the use of commercial tools as well as graduate students of engineering the text explains the design issues guidelines and CAD tools for the power distribution of the VLSI chip and package and provides numerous examples for its effective application Features of the text include An introduction to power distribution network design Design perspectives such as power network planning layout specifications decoupling capacitance insertion modeling and analysis Electromigration phenomena IR drop analysis methodology Commands and user interfaces of the VoltageStorm™ CAD tool Microprocessor design examples using on chip power distribution Flip chip and package design issues Power network measurement techniques from real silicon The author includes several case studies and a glossary of key words and basic terms to help readers understand and integrate basic concepts in VLSI design and power distribution

Partitioning Design Approach for the Reliable Design of Highly Efficient RF Power Amplifiers Roshanak

Lehna, 2017-11-13 The modern wireless communication systems require modulated signals with wide modulation bandwidth This in turns requires signals with very high dynamic range and peak to average power ratio PAPR This means that the amplifier in the base station has to work at a power back off as large as the dynamic range of the signal so that the amplifier has a high linearity in this region For the standard single stage amplifiers this large power back off reduces the efficiency dramatically In this work a three way Doherty power amplifier DPA aiming at high power efficiency within a dynamic range of 9.5 dB is designed and fabricated using partitioning design approach The partitioning design approach decomposes a complex design task into small sized well controllable and verifiable subcircuits This advanced straight forward method has shown very promising results Using this design approach a three way DPA has been designed to demonstrate the advantages of this reliable design technique as well Based on the design of a single stage power amplifier and proposing a novel output power combiner a 6 W three way DPA has been designed which allows the mandatory load modulation principle in three way DPA structures to be realized with simpler elements whereas the design of a standard Doherty combiner would have been very challenging and not practical due to the extremely small value of its characteristic line impedance The proposed combiner is calculated for a three way DPA with 2 mm AlGaN GaN HEMTs The simulation result shows a very good load modulation for the amplifier which confirms the theoretical expectation for a three way DPA The efficiency of the designed 6 W three way DPA at large back off shows very promising values compared to recently reported amplifiers The measured IMD3 products confirm the good linearity of the amplifier as well Accordingly the proposed power combiner and the design strategy are recommended to be used as the preferred option for designing three way DPA structures with very high output power
