IBM i 7.6 features and function Henry Vo, Tim Simon, Larry Bolhuis, Ivaylo Bozhinov, Steve Bradshaw, Rohit Chauhan, Ryan Cooper, Scott Forstie, Ben Huntsman, Marius le Roux, Michael Miller, Harold Nelson, Tim Rowe, Prashant Sharma, Shamej Sreedharan, Rudi van Helvoirt, IBM Redbooks, 2025-07-01 IBM i is a robust and integrated operating system developed by IBM. It currently is one of the operating systems that runs on IBM Power Systems servers. IBM i is known for its strong emphasis on stability, security, and business-critical applications. IBM i provides a unique architecture that combines a database, middleware, and operating system into a single cohesive environment, simplifying IT management and reducing total cost of ownership. It is a vital platform for many businesses, particularly those requiring highly reliable and scalable solutions, and continues to be modernized to incorporate current technologies like cloud integration and open source capabilities. This IBM Redbooks publication provides a technical overview of the features, functions, and enhancements available in IBM i 7.6. It provides a summary and brief explanation of the many capabilities and functions in the operating system. It also describes many of the licensed programs and application development tools that are associated with IBM i. IBM i has always focused on security, and IBM i 7.6 has several new features to increase security of your IBM i LPARs. One of the major components introduced in IBM i 7.6 is built-in support for Multi Factor Authentication (MFA) in the operating system. In previous releases, there were external solutions, for example PowerSC, that provided MFA, but in IBM i 7.6, support for MFA is included in the operating system. IBM i 7.6 also includes additional support for encryption, allowing encryption of ASP1. The information provided in this book is useful for clients, IBM Business Partners, and IBM service professionals who are involved with planning, supporting, upgrading, and implementing IBM i 7.6 solutions.

Global Change and River Ecosystems - Implications for Structure, Function and Ecosystem Services R. Jan Stevenson, Sergi Sabater, 2015-03-21 Rivers around the world are threatened by changes in land use, climate, hydrologic cycles, and biodiversity. Global changes in rivers include, but are not restricted to, water flow interruptions, temperature increases, loss of hydrological connectivity, altered water residence times, changes in nutrient loads, increasing arrival of new chemicals, simplification of the physical structure of the systems, occurrence of invasive species, and biodiversity losses. All of them affect the structure and functioning of the river ecosystem and thereby their ecosystem services. Understanding the responses of river ecosystems and their services to global change is essential for protecting human well-being in all corners of the planet. Rivers provide critical benefits by providing food from fisheries and irrigation, regulating biogeochemical balances, and enriching our aesthetic and cultural experience. Predicting responses of rivers to global change is challenged by the complexity of interactions among these man-made drivers across a mosaic of natural hydrogeomorphic and climatic settings. This book explores the broad range of determinants defining global change and their effects on river ecosystems. Authors have provided thoughtful and insightful treatments of specific topics that relate to the broader theme of global change regulation of river ecosystems.
