**Reinforcement Learning and Optimal Control** Dimitri Bertsekas, 2019-07-01 This book considers large and challenging multistage decision problems which can be solved in principle by dynamic programming DP but their exact solution is computationally intractable We discuss solution methods that rely on approximations to produce suboptimal policies with adequate performance These methods are collectively known by several essentially equivalent names reinforcement learning approximate dynamic programming neuro dynamic programming They have been at the forefront of research for the last 25 years and they underlie among others the recent impressive successes of self learning in the context of games such as chess and Go Our subject has benefited greatly from the interplay of ideas from optimal control and from artificial intelligence as it relates to reinforcement learning and simulation based neural network methods One of the aims of the book is to explore the common boundary between these two fields and to form a bridge that is accessible by workers with background in either field Another aim is to organize coherently the broad mosaic of methods that have proved successful in practice while having a solid theoretical and or logical foundation This may help researchers and practitioners to find their way through the maze of competing ideas that constitute the current state of the art This book relates to several of our other

books Neuro Dynamic Programming Athena Scientific 1996 Dynamic Programming and Optimal Control 4th edition Athena Scientific 2017 Abstract Dynamic Programming 2nd edition Athena Scientific 2018 and Nonlinear Programming Athena Scientific 2016 However the mathematical style of this book is somewhat different While we provide a rigorous albeit short mathematical account of the theory of finite and infinite horizon dynamic programming and some fundamental approximation methods we rely more on intuitive explanations and less on proof based insights Moreover our mathematical requirements are quite modest calculus a minimal use of matrix vector algebra and elementary probability mathematically complicated arguments involving laws of large numbers and stochastic convergence are bypassed in favor of intuitive explanations The book illustrates the methodology with many examples and illustrations and uses a gradual expository approach which proceeds along four directions a From exact DP to approximate DP We first discuss exact DP algorithms explain why they may be difficult to implement and then use them as the basis for approximations b From finite horizon to infinite horizon problems We first discuss finite horizon exact and approximate DP methodologies which are intuitive and mathematically simple and then progress to infinite horizon problems c From deterministic to stochastic models We often discuss separately deterministic and stochastic problems since deterministic problems are simpler and offer special advantages for some of our methods d From model based to model free implementations We first discuss model based implementations and then we identify schemes that can be appropriately modified to work with a simulator The book is related and supplemented by the companion research monograph Rollout Policy Iteration and Distributed Reinforcement Learning Athena Scientific 2020 which focuses more closely on several topics related to rollout approximate policy iteration multiagent problems discrete and Bayesian optimization and distributed computation which are either discussed in less detail or not covered at all in the present book The author s website contains class notes and a series of videolectures and slides from a 2021 course at ASU which address a selection of topics from both books

*Network Optimization Methods in Passivity-Based Cooperative Control* Miel Sharf, 2021-05-24 This book establishes an important mathematical connection between cooperative control problems and network optimization problems It shows that many cooperative control problems can in fact be understood under certain passivity assumptions using a pair of static network optimization problems Merging notions from passivity theory and network optimization it describes a novel network optimization approach that can be applied to the synthesis of controllers for diffusively coupled networks of passive or passivity short dynamical systems It also introduces a data based model free approach for the synthesis of network controllers for multi agent systems with passivity short agents Further the book describes a method for monitoring link faults in multi agent systems using passivity theory and graph connectivity It reports on some practical case studies describing the effectivity of the developed approaches in vehicle networks All in all this book offers an extensive source of information and novel methods in the emerging field of multi agent cooperative control paving the way to future developments of autonomous systems for various application domains

Abstract Dynamic Programming Dimitri Bertsekas, 2022-01-01 This is the 3rd edition of a research monograph providing a synthesis of old research on the foundations of dynamic programming DP with the modern theory of approximate DP and new research on semicontractive models It aims at a unified and economical development of the core theory and algorithms of total cost sequential decision problems based on the strong connections of the subject with fixed point theory The analysis focuses on the abstract mapping that underlies DP and defines the mathematical character of the associated problem The discussion centers on two fundamental properties that this mapping may have monotonicity and weighted sup norm contraction It turns out that the nature of the analytical and algorithmic DP theory is determined primarily by the presence or absence of these two properties and the rest of the problem's structure is largely inconsequential New research is focused on two areas 1 The ramifications of these properties in the context of algorithms for approximate DP and 2 The new class of semicontractive models exemplified by stochastic shortest path problems where some but not all policies are contractive The 3rd edition is very similar to the 2nd edition except for the addition of a new chapter

Chapter 5 which deals with abstract DP models for sequential minimax problems and zero sum games The book is an excellent supplement to several of our books Neuro Dynamic Programming Athena Scientific 1996 Dynamic Programming and Optimal Control Athena Scientific 2017 Reinforcement Learning and Optimal Control Athena Scientific 2019 and Rollout Policy Iteration and Distributed Reinforcement Learning Athena Scientific 2020 **Soft Computing Techniques in Solid Waste and Wastewater Management** Rama Rao Karri,R Gobinath,Mohammad Hadi Dehghani,2021-07-24 Soft Computing Techniques in Solid Waste and Wastewater Management is a thorough guide to computational solutions for researchers working in solid waste and wastewater management operations This book covers in depth analysis of process variables their effects on overall efficiencies and optimal conditions and procedures to improve performance using soft computing techniques These topics coupled with the systematic analyses described will help readers understand various techniques that can be effectively used to achieve the highest performance In depth case studies along with discussions on applications of various soft computing techniques help readers control waste processes and come up with short term mid term and long term strategies Waste management is an increasingly important field due to rapidly increasing levels of waste production around the world Numerous potential solutions for reducing waste production are underway including applications of machine learning and computational studies on waste management processes This book details the diverse approaches and techniques in these fields providing a single source of information researchers and industry practitioners It is ideal for academics researchers and engineers in waste management environmental science environmental engineering and computing with relation to environmental science and waste management Provides a comprehensive reference on the implementation of soft computing techniques in waste management drawing together current research and future implications Includes detailed algorithms used enabling authors to understand and appreciate potential applications Presents relevant case studies in solid and wastewater management that show real world applications of discussed technologies

Nonlinear Programming Dimitri Bertsekas,2016-09-01 This book provides a comprehensive and accessible presentation of algorithms for solving continuous optimization problems It relies on rigorous mathematical analysis but also aims at an intuitive exposition that makes use of visualization where possible It places particular emphasis on modern developments and their widespread applications in fields such as large scale resource allocation problems signal processing and machine learning The 3rd edition brings the book in closer harmony with the companion works Convex Optimization Theory Athena Scientific 2009 Convex Optimization Algorithms Athena Scientific 2015 Convex Analysis and Optimization Athena Scientific 2003 and Network Optimization Athena Scientific 1998 These works are complementary in that they deal primarily with convex possibly nondifferentiable optimization problems and rely on convex analysis By contrast the nonlinear programming book focuses primarily on analytical and computational methods for possibly nonconvex differentiable problems It relies primarily on calculus and variational analysis yet it still contains a detailed presentation of duality theory and its uses for

both convex and nonconvex problems This on line edition contains detailed solutions to all the theoretical book exercises Among its special features the book Provides extensive coverage of iterative optimization methods within a unifying framework Covers in depth duality theory from both a variational and a geometric point of view Provides a detailed treatment of interior point methods for linear programming Includes much new material on a number of topics such as proximal algorithms alternating direction methods of multipliers and conic programming Focuses on large scale optimization topics of much current interest such as first order methods incremental methods and distributed asynchronous computation and their applications in machine learning signal processing neural network training and big data applications Includes a large number of examples and exercises Was developed through extensive classroom use in first year graduate courses *Rollout, Policy Iteration, and Distributed Reinforcement Learning* Dimitri Bertsekas, 2021-08-20 The purpose of this book is to develop in greater depth some of the methods from the author's Reinforcement Learning and Optimal Control recently published textbook Athena Scientific 2019 In particular we present new research relating to systems involving multiple agents partitioned architectures and distributed asynchronous computation We pay special attention to the contexts of dynamic programming policy iteration and control theory model predictive control We also discuss in some detail the application of the methodology to challenging discrete combinatorial optimization problems such as routing scheduling assignment and mixed integer programming including the use of neural network approximations within these contexts The book focuses on the fundamental idea of policy iteration i.e. start from some policy and successively generate one or more improved policies If just one improved policy is generated this is called rollout which based on broad and consistent computational experience appears to be one of the most versatile and reliable of all reinforcement learning methods In this book rollout algorithms are developed for both discrete deterministic and stochastic DP problems and the development of distributed implementations in both multiagent and multiprocessor settings aiming to take advantage of parallelism Approximate policy iteration is more ambitious than rollout but it is a strictly off line method and it is generally far more computationally intensive This motivates the use of parallel and distributed computation One of the purposes of the monograph is to discuss distributed possibly asynchronous methods that relate to rollout and policy iteration both in the context of an exact and an approximate implementation involving neural networks or other approximation architectures Much of the new research is inspired by the remarkable AlphaZero chess program where policy iteration value and policy networks approximate lookahead minimization and parallel computation all play an important role **Design, Implementierung und Evaluierung von**

**Advances in Computational Intelligence in Transport, Logistics, and Supply Chain Management** Andreas Fink, Franz Rothlauf, 2008 The book at hand presents a careful selection of relevant applications of CI methods for transport logistics and supply chain management problems The chapters illustrate the current state of the art in the application of CI methods in these fields and should help and inspire researchers and practitioners to apply and develop efficient methods A few contributions in this book are extended versions of papers presented at EvoTransLog2007 The First European Workshop on Evolutionary Computation in Transportation and Logistics which was held in Valencia Spain in 2007 The majority of contributions are from additional specially selected researchers who have done relevant work in different areas of transport logistics and supply chain management The goal is to broadly cover representative applications in these fields as well as different types of solution approaches On the application side the contributions focus on design of traffic and transportation networks vehicle routing and other important aspects of supply chain management such as inventory management lot sizing and lot scheduling On the method side the contributions deal with evolutionary algorithms local search approaches and scatter search combined with other CI techniques such as neural networks or fuzzy approaches The book is structured according to the application domains Thus it has three parts dealing with traffic and transportation networks vehicle routing and supply chain management
