Proceedings of the South African Information Security Multi-Conference Nathan Clarke,Steven Furnell,Rossouw Von Solms,University of Plymouth. Centre for Security, Communications and Network Research,2011-02 **Fundamentals of Stochastic Networks** Oliver C. Ibe,2011-08-24 An interdisciplinary approach to understanding queueing and graphical networks In today s era of interdisciplinary studies and research activities network models are becoming increasingly important in various areas where they have not regularly been used Combining techniques from stochastic processes and graph theory to analyze the behavior of networks Fundamentals of Stochastic Networks provides an interdisciplinary approach by including practical applications of these stochastic networks in various fields of study from engineering and operations management to communications and the physical sciences The

author uniquely unites different types of stochastic queueing and graphical networks that are typically studied independently of each other. With balanced coverage, the book is organized into three succinct parts. Part I introduces basic concepts in probability and stochastic processes with coverage on counting, Poisson, renewal, and Markov processes. Part II addresses basic queueing theory with a focus on Markovian queueing systems and also explores advanced queueing theory, queueing networks, and approximations of queueing networks. Part III focuses on graphical models, presenting an introduction to graph theory along with Bayesian, Boolean, and random networks. The author presents the material in a self-contained style that helps readers apply the presented methods and techniques to science and engineering applications. Numerous practical examples are also provided throughout, including all related mathematical details. Featuring basic results without heavy emphasis on proving theorems, *Fundamentals of Stochastic Networks* is a suitable book for courses on probability and stochastic networks, stochastic network calculus, and stochastic network optimization at the upper undergraduate and graduate levels. The book also serves as a reference for researchers and network professionals who would like to learn more about the general principles of stochastic networks.

Organizational Network Analysis Anna Ujwary-Gil, 2019-12-11

The integrated meta-model for organizational resource audit is a consistent and comprehensive instrument for auditing intangible resources and their relations and associations from the network perspective. This book undertakes a critically important problem of management sciences, poorly recognized in literature, although determining the current and future competitiveness of enterprises, sectors, and economies. The author notes the need to introduce a theoretical input which is manifested by the meta-model. An expression of this treatment is the inclusion of the network as a structure of activities, further knowledge as an activity, and intangible assets as intellectual capital, characterized by a structure of connections. The case study presented is an illustration of the use of network analysis tools and other instruments to identify not only the most important resources, tasks, or actors, as well as their effectiveness, but also to connect the identified networks with each other. The author opens the field for applying her methodology, revealing the structural and dynamic features of the intangible resources of the organization. The novelty of the proposed meta-model shows the way to in-depth applications of network analysis techniques in an intra-organizational environment. *Organizational Network Analysis* makes a significant contribution to the development of management sciences in terms of strategic management and more strictly resource approach to the company through structural definition of knowledge, application of the concept of improvement-oriented audit, abandoning a narrow understanding of this technique in terms of compliance, reliable presentation of audits available in the literature, rigorous reasoning leading to the development of a meta-model, close linking of knowledge and resources with the strategy at the design stage of the developed audit model, including the analysis of link dynamics and networks together with an extensive metrics proposal, an interesting illustration of the application with the use of metrics tables and charts. It will be of value to researchers, academics, managers, and students in the fields of strategic management, organizational studies, social

cant and elegant results have been achieved on the theory, algorithms and applications of network flow optimization in the past few decades. See for example the seminal books written by Ahuja, Magnanti and Orlin 1993, Bazaraa, Jarvis and Sherali 1990, Bertsekas 1998, Ford and Fulkerson 1962, Gupta 1985, Iri 1969, Jensen and Barnes 1980, Lawler 1976 and Minieka 1978. Most network optimization problems that have been studied up to date are however static in nature in the sense that it is assumed that it takes zero time to traverse any arc in a network and that all attributes of the network are constant without change at any time. Networks in the real world are nevertheless time varying in essence in which any flow must take a certain amount of time to traverse an arc and the network structure and parameters such as arc and node capacities may change over time. In such a problem, how to plan and control the transmission of flow becomes very important since waiting at a node or travelling along a particular arc with different speed may allow one to catch the best timing along his path and therefore achieve his overall objective such as a minimum overall cost or a minimum travel time from the origin to the destination.
