Reliability and Their Data Processing was motivated by the 1988 Redundant Array of Inexpensive Independent Disks proposal to replace large form factor mainframe disks with an array of commodity disks. Disk loads are balanced by striping data into strips with one strip per disk and storage reliability is enhanced via replication or erasure coding which at best dedicates k strips per stripe to tolerate k disk failures. Flash memories have resulted in a paradigm shift with Solid State Drives (SSDs) replacing Hard Disk Drives (HDDs) for high performance applications. RAID and Flash have resulted in the emergence of new storage companies namely EMC, NetApp, SanDisk and Purestorage and a multibillion dollar storage market. Key new conferences and publications are reviewed in this book. The goal of the book is to expose students, researchers and IT professionals to the more important developments in storage systems while covering the evolution of storage technologies, traditional and novel databases and novel sources of data. We describe several prototypes: FAWN at CMU, RAMCloud at Stanford and Lightstore at MIT. Oracle's Exadata, AWS Aurora, Alibaba's PolarDB, Fungible Data Center and author's paper designs for cloud storage namely heterogeneous disk arrays and hierarchical RAID. Surveys storage technologies and lists sources of data measurements: text, audio, images and video. Familiarizes with paradigms to improve performance: caching, prefetching, log structured file systems and merge trees. LSMs. Describes RAID organizations and analyzes their performance and reliability. Conserves storage via data compression, deduplication, compaction and secures data via encryption. Specifies implications of storage technologies on performance and power consumption. Exemplifies database parallelism for big data analytics, deep learning via multicore CPUs, GPUs, FPGAs and ASICs e.g. Google's Tensor Processing Units.

A Framework for Real-time 3D Reconstruction by Space Carving using Graphics Hardware. Christian Nitschke, 2012-03-02. Diploma Thesis from the year 2006 in the subject Communications Research Studies Enquiries grade 1. University of Weimar, language English. abstract: Reconstruction of real world scenes from a set of multiple images is a topic in Computer Vision and 3D Computer Graphics with many interesting applications. There exists a powerful algorithm for shape reconstruction from arbitrary viewpoints called Space Carving. However, it is computationally expensive and hence cannot be used with applications in the field of 3D video or CSCW as well as interactive 3D model creation. Attempts have been

made to achieve real time framerates using PC cluster systems While these provide enough performance they are also expensive and less flexible Approaches that use GPU hardware acceleration on single workstations achieve interactive framerates for novel view synthesis but do not provide an explicit volumetric representation of the whole scene The proposed approach shows the efforts in developing a GPU hardware accelerated framework for obtaining the volumetric photo hull of a dynamic 3D scene as seen from multiple calibrated cameras High performance is achieved by employing a shape from silhouette technique in advance to obtain a tight initial volume for Space Carving Also several speed up techniques are presented to increase efficiency Since the entire processing is done on a single PC the framework can be applied to mobile setups enabling a wide range of further applications The approach is explained using programmable vertex and fragment processors with current hardware and compared to highly optimized CPU implementations It is shown that the new approach can outperform the latter by more than one magnitude The downloadable introduction has been written specifically for this offer Its contents are only a subset of the real introductory chapter of the thesis
