Thriving: How Crops Perceive and Respond to Temperature Stress Zemin Wang,Yi Wang ,Darren Wong,2025-01-27

The dramatic temperature fluctuations spurred by climate change inhibit plant growth and threaten crop productivity Unraveling how plants defend themselves against temperature stress induced cellular impairment is not only a crucial fundamental issue but is also of critical importance for agricultural sustainability and food security Improving crop tolerance to abiotic stress conditions requires a deep understanding of the response of plants to changes in their environment This response is dependent on early and late signal transduction events that involve important signaling molecules such as reactive oxygen species ROS sugars different plant hormones and other signaling molecules It is the integration of these signaling events mediated by an interplay between ROS sugars and different plant hormones that orchestrates the plant response to abiotic stress and drive changes in transcriptomic metabolic and proteomic networks that lead to plant acclimation and survival This Research Topic explores the crops balancing growth and temperature stress responses and how these findings can be used to increase crop quality and yield potential **Plant Microbiome: Interactions, Mechanisms**

of Action, and Applications, volume III Alok Kumar Srivastava,George Newcombe,Gustavo Santoyo ,Prem Lal

Kashyap,2025-11-11 Due to the success of the original Research Topic and the following Volume II we have decided to launch a Volume III of Plant Microbiome Interactions Mechanisms of Action and Applications The relationship between plants and their surroundings especially those plant microbe interactions with a beneficial output remain the center of considerable attention Plants depend on their microbiomes for multifarious life supporting activities including nutrient acquisition and augmentation of their defense systems against biotic and abiotic stresses The interactions between a plant and its microbiome are highly complex and dynamic in nature The plant immune system in particular is thought to have a profound impact in determining the plant microbiome structure and diversity Characterizing the plant microbiome and its function could be applied for better crop design and management especially in resource limited environments and to protect plants from intruding pathogens Therefore a deep understanding of the interrelationships of the soil plant microorganism system is essential for improving the efficacy and potential applications of plant growth promoting inocula for achieving sustainable food security and development Recent studies of plant growth promoting rhizobacteria show that cocktails of useful bacteria

in the form of synthetic communities are better than single inoculants which face competition from other microorganisms and could be killed or suppressed under sub optimal conditions Microbial activity should also be considered in the construction of microbial co inoculants Understanding plant microbe interactions and mechanisms will also help in the development of smart microbial fertilizer formulation and application in the future This Research Topic welcomes the following subtopics Interactomics for sustainable agriculture studies using novel combinatorial approaches employing computational expertise to analyze the data from genomics transcriptomics metabolomics and proteomics based studies leading to identification of targets and validating wet lab experiments with molecular evidence for resolving issues in agriculture and sustainability Please note that purely descriptive sequencing studies will not be considered Plant microbiome studies deciphering the structure and composition of complex microbial communities associated directly or indirectly with the plant i e endophytic epiphytic and rhizospheric communities and their significance Topic Editors Alok Kumar Srivastava and Prem Lal Kashyap have created commercial products related to the Topic All other topic editors declare no competing interests with regard to the Research Topic subject

Plant Protein and Proteome Atlas--Integrated Omics Analyses of Plants under Abiotic Stresses Tingyun Kuang,Xuchu Wang,Xiaochun Qin,Shaojun Dai,Pingfang Yang,Ling Li,2020-05-22 Integrative omics of plants in response to stress conditions play more crucial roles in the post genomic era High quality genomic data provide more deeper understanding of how plants to survive under environmental stresses This book is focused on concluding the recent progress in the Protein and Proteome Atlas in plants under different stresses It covers various aspects of plant protein ranging from agricultural proteomics structure and function of proteins and approaches for protein identification and quantification A total of 27 papers including two timely reviews have contributed to this Special Issue In the first part with the topic of Comparative Proteomics of Different Plants six papers were included to describe the phenotypic changes and proteomic analyses of different plants under different conditions Then another six papers with the topic of Proteomics of Plants under Osmotic Stress were included to describe the recent comparative proteomics analyses of plants under osmotic stress particularly the drought and salinity stresses in leaves of certain plant species The other proteomics studies on several energy plants and economic crops were reported to demonstrate the recent omics studies on different plants during their development processes More stress responsive genes and proteins in these plants were identified These target genes and proteins are important candidates for further functional validation in economic plants and crops
