for overseas institutions to establish relationships with Mainland China AI Adoption and Inequality Emma J Rockall, Ms. Marina Mendes Tavares, Carlo Pizzinelli, 2025-04-04 There are competing narratives about artificial intelligence's impact on inequality. Some argue AI will exacerbate economic disparities while others suggest it could reduce inequality by primarily disrupting high income jobs. Using household microdata and a calibrated task based model we show these narratives reflect different channels through which AI affects the economy. Unlike previous waves of automation that increased both wage and wealth inequality AI could reduce wage inequality through the displacement of high income workers. However two factors may counter this effect: these workers' tasks appear highly complementary with AI potentially increasing their productivity and they are better positioned to benefit from higher capital returns. When firms can choose how much AI to adopt the wealth inequality effect is particularly pronounced as the potential cost savings from automating high wage tasks drive significantly higher adoption rates. Models that ignore this adoption decision risk understating the trade off policymakers face between inequality and efficiency **Artificial Intelligence and Society** Dr. R. B. Konda, Dr. Mahesh M. The integration of AI powered e gamified modules in education has significantly impacted students' scientific attitudes and academic achievement in science. This study investigates how AI driven gamification enhances engagement, critical thinking and problem solving skills leading to improved academic performance. AI enables personalized learning experiences by adapting to individual student needs thus fostering a more interactive and learner centered approach. E gamified modules provide immediate feedback motivating students to correct errors and reinforce learning. The main aim of the study is to find out whether there is any significant difference between pre test post test mean scores of secondary school students taught with and without AI powered e gamified modules in science. 80 Samples were chosen by employing purposive sampling technique. The researcher has used standardized PhET simulation modules. The results show that the post test mean scores of the experimental group are significantly different than that of the control group. The study suggests that when students are exposed to AI powered gamified learning environments they develop a more positive disposition toward scientific methods and show measurable improvements in performance. This research highlights the potential of AI in transforming traditional education by making learning more dynamic, personalized and effective thereby fostering a deeper understanding of science and its applications.
