Environmental Design Guidelines for Low Crested Coastal Structures Stephen J. Hawkins, Hans Falk Burcharth, Barbara Zanuttigh, Alberto Lamberti, 2010-07-07 The effect of manmade activities is primarily local but can extend far away from the location of intervention This underlines the importance of establishing coastal zone management plans covering large stretches of coastlines In recent years interest in Low Crested Structures coastal defense structures with a low crest has been growing together with awareness of the sensitivity to environmental impacts produced by coastal defenses The relation between wave climate beach erosion beach defence means habitat changes and beach value which clearly exists based on EC research results suggests the necessity of an integrated approach when designing coastal protection schemes In accordance with this need the present design guidelines cover structure stability and construction problems hydro and morphodynamic effects environmental effects colonisation of the structure and water quality societal and economic impacts recreational benefits swimming safety beach quality *Environmental Design Guidelines for Low Crested Coastal Structures* is specifically dedicated to Low Crested Structures and provides methodological tools both for the engineering design of structures and for the prediction of performance and environmental impacts of such structures A briefing of current best practice for local and national planning authorities statutory agencies and other stakeholders in the coastal zone is also covered Presented in a generic way this book is appropriate throughout the European Union taking into account current European Commission policy and directives for the promotion of sustainable development and integrated coastal zone management Fills the gap between engineering and ecology in coastal defense planning Shows the reader how to perform an integrated design of coastal defense schemes Presents latest insights on hydro morphodynamics induced by structures Provides directly applicable tools for the design of low crested structures Highlights socio economic perspectives in coastal defense design

Dynamics of the Coastal Zone Matteo Postacchini, Alessandro Romano, 2020-03-19 The coastal zone is the host to many human activities which have significantly increased in the last decades However sea level rise and more frequent storm events severely affect beaches and coastal structures with negative consequences and dramatic impacts on coastal communities These aspects add to typical coastal problems like flooding and beach erosion which already leading to large economic losses and human fatalities Modeling is thus fundamental for an exhaustive understanding of the nearshore region in the present and future environment Innovative tools and technologies may help to better understand coastal processes in terms of hydrodynamics sediment transport bed morphology and their interaction with coastal structures This book collects several contributions focusing on nearshore dynamics and span among several time and spatial scales using both physical

and numerical approaches The aim is to describe the most recent advances in coastal dynamics Environmentally Friendly Coastal Protection Claus Zimmermann, Robert G. Dean, Valeri Penchev, Henk Jan Verhagen, 2006-03-30 Coast lines have been and still are the central lines of civilization around the world with still increasing pressure from both sides the hinterland and the sea with all its foreseeable and unforeseeable impacts by means of nature or mankind While the response of nature to such impacts is flexible in the way that all morphological changes with all the consequences are tolerated as part of the system humanity cannot tolerate short term or long term changes without being threatened in its physical and economical existence The objectives of this Advanced Research Workshop ARW on Environmentally Friendly Coastal Structures were to contribute to the critical assessment of existing knowledge in the field of coastal and environmental protection to identify directions for future research in that area to promote close working relationships between scientists from different countries and with different professional experience The latest trends in research on coastal and environmental protection were summarized and developed during the meeting Seventeen papers are presented in this book attempting to cover all related aspects as completely as possible coast engineering structures water sediments ecosystems in their complicated interaction

Morphodynamic Model for Predicting Beach Changes Based on Bagnold's Concept and Its Applications Takaaki Uda, 2018-12-19 The authors have developed models for predicting beach changes applicable to various problems on real coasts One of them is the contour line change model to predict long term beach changes caused by the imbalance in longshore sand transport which is a kind of N line model Because the calculation of the nearshore current is not needed in this model and the computational load is small it has an advantage in the prediction of long term topographic changes on an extensive coast However the handling of boundary conditions becomes difficult when offshore coastal structures are constructed in a complicated manner and in this regard the so called 3D model has an advantage Taking this point into account the authors developed a morphodynamic model BG model by applying the concept of the equilibrium slope and the energetics approach in which depth changes on 2D horizontal grids are calculated **Sustainable Management of Urban**

Water Resources Susanne Charlesworth, Craig Lashford, 2021-01-28 It is well known that 55% of the world's population currently lives in urban areas and this figure is predicted to grow to 68% by 2050 adding more than 2.5 billion people to urban populations It is also projected that there will be 43 megacities worldwide by 2030 with populations of more than 10 million inhabitants The United Nations World Water Development Report 2018 warned that by 2030 the global demand for fresh water is likely to exceed supply by 40% Added to population growth climate change has the potential to lead to changes in rainfall regimes with the potential of increased flooding and drought Currently 1.2 billion people are at risk from flooding but this is predicted to increase to about 1.6 billion i.e. nearly 20% of the total world population by 2050 In line with this replacing deteriorating water management infrastructure that can no longer cope is economically unfeasible impracticable from a construction point of view and likely to fail in the long term To address these issues approaches are needed that are

flexible and have multiple benefits In its World Water Development Report 2018 the UN promotes the use of nature based solutions to some of these problems with the focus of Sustainable Development Goal 6 making sure that everyone has access to a safe and affordable supply of potable water and sanitation by 2030 requiring investment in suitable infrastructure across the world This Special Issue covers the challenges faced in managing urban water in all its forms from potable supplies to reuse and harvesting as well as resilient and sustainable approaches developed to address flooding and drought **Beach**
