

Medical Case Study

Title: Concise, informative title that encapsulates key aspects of the case

Abstract:

This review describes the case of a 55 year old female patient who was diagnosed with Stage II breast cancer at age 50. The patient underwent chemotherapy for four months, after which time she was declared in remission. At age 54 the cancer reappeared and more frequent chemotherapy sessions were given, though the tumor was largely unresponsive. Resultingly, the patient underwent a modified radical mastectomy alongside later chemotherapy. The surgery was found to be successful in stopping the spread of invasive cancer. At three months post-op the patient was declared to be in remission.

Objectives:

The key objectives of this case study are to report the patient's treatment details for staff reflection purposes. This will help identify the factors that led to remission and the factors that led to re-diagnosis, including any potential inaccuracies in the assessment made of the patient's risk or reoccurrence following the original remission.

Patient demographic information

Age: 55

Gender: female

Ethnicity: European

Occupation: Veterinarian

Clinical history

Symptoms:

The patient was diagnosed with stage II breast cancer at age 50. At the original diagnosis, the cancer was contained in the breast tissue and had not yet spread to lymph nodes. At age 54 patient reported an increase in pain in the breast and lower back, and tumor was found to have recurred.

Family history and lifestyle factors:

Patient smoked between ages 19 and 35, stopped when diagnosed with high blood pressure. Blood pressure has been managed since with diet. No family history of breast cancer.
