Gordon Emslie, Anna Maria Massone, Brian R. Dennis, 2022-01-01 The idea for this text emerged over several years as the authors participated in research projects related to analysis of data from NASA's RHESSI Small Explorer mission The data produced over the operational lifetime of this mission inspired many investigations related to a specific science question the when where and how of electron acceleration during solar flares in the stressed magnetic environment of the active Sun A vital key to unlocking this science problem is the ability to produce high quality images of hard X rays produced by bremsstrahlung radiation from electrons accelerated during a solar flare The only practical way to do this within the technological and budgetary limitations of the RHESSI era was to opt for indirect modalities in which imaging information is encoded as a set

of two dimensional spatial Fourier components Radio astronomers had employed Fourier imaging for many years However differently than for radio astronomy X ray images produced by RHESSI had to be constructed from a very limited number of sparsely distributed and very noisy Fourier components Further Fourier imaging is hardly intuitive and extensive validation of the methods was necessary to ensure that they produced images with sufficient accuracy and fidelity for scientific applications This book summarizes the results of this development of imaging techniques specifically designed for this form of data It covers a set of published works that span over two decades during which various imaging methods were introduced validated and applied to observations Also considering that a new Fourier based telescope STIX is now entering its nominal phase on board the ESA Solar Orbiter it became more and more apparent to the authors that it would be a good idea to put together a compendium of these imaging methods and their applications Hence the book you are now reading
