Benchmarking Transaction and Analytical Processing Systems Anja Bog,2013-07-11 Systems for Online Transaction Processing OLTP and Online Analytical Processing OLAP are currently separate The potential of the latest technologies and changes in operational and analytical applications over the last decade have given rise to the unification of these systems which can be of benefit for both workloads Research and industry have reacted and prototypes of hybrid database systems are now appearing Benchmarks are the standard method for evaluating comparing and supporting the development of new database systems Because of the separation of OLTP and OLAP systems existing benchmarks are only focused on one or the other With the rise of hybrid database systems benchmarks to assess these systems will be needed as well Based on the examination of existing benchmarks a new benchmark for hybrid database systems is introduced in this book It is furthermore used to determine the

effect of adding OLAP to an OLTP workload and is applied to analyze the impact of typically used optimizations in the historically separate OLTP and OLAP domains in mixed workload scenarios

Non-Volatile Memory Database Management Systems Joy Arulraj, Andrew Pavlo, 2022-06-01 This book explores the implications of non volatile memory NVM for database management systems DBMSs The advent of NVM will fundamentally change the dichotomy between volatile memory and durable storage in DBMSs These new NVM devices are almost as fast as volatile memory but all writes to them are persistent even after power loss Existing DBMSs are unable to take full advantage of this technology because their internal architectures are predicated on the assumption that memory is volatile With NVM many of the components of legacy DBMSs are unnecessary and will degrade the performance of data intensive applications We present the design and implementation of DBMS architectures that are explicitly tailored for NVM The book focuses on three aspects of a DBMS 1 logging and recovery 2 storage and buffer management and 3 indexing First we present a logging and recovery protocol that enables the DBMS to support near instantaneous recovery Second we propose a storage engine architecture and buffer management policy that leverages the durability and byte addressability properties of NVM to reduce data duplication and data migration Third the book presents the design of a range index tailored for NVM that is latch free yet simple to implement All together the work described in this book illustrates that rethinking the fundamental algorithms and data structures employed in a DBMS for NVM improves performance and availability reduces operational cost and simplifies software development

Databases in Telecommunications II Willem Jonker, 2003-06-30 Just like the previous workshop at VLDB 1999 in Edinburgh the purpose of this workshop is to promote telecom data

management as one of the core research areas in database research and to establish a strong connection between the telecom and database research communities As I wrote in the preface of those proceedings data management in telecommunications is an interesting area of research given the fact that both service management and service provisioning are very data intensive and pose extreme requirements on data management technology Given the feedback on the previous workshop we decided to keep the same program set up for this workshop an invited speaker a collection of research papers and a panel discussion We received 18 good quality papers from which we selected 12 to construct a very interesting program The program has been divided into four sections The first section focuses on CDR data warehouse and data mining technology Data warehousing and data mining around customer usage data remains an important area of interest for telecommunication operators The growing competition especially in the mobile market means that operators have to put more effort into customer retention and satisfaction The second section focuses on performance issues around databases in telecommunication Since telecommunication databases are characterized by their extreme requirements for example in terms of volumes of data to be processed or response times high volume data management and embedded and real time data management are key aspects of the telecommunication data management problems in today s operational environments
