Object Lessons Caren Holtzman, Lynn Susholtz, 2024-11-15. When Caren Holtzman and Lynn Susholtz look around a classroom they see a veritable goldmine of mathematical investigations involving number, measurement, size, shape, symmetry, ratio, and proportion. They also think of the ways great artists have employed these concepts in their depictions of objects and space, for example Picasso's use of geometric shapes in his Cubist still lifes or contemporary artist Tara Donovan's room-sized sculptures of everyday items. In their new book *Object Lessons*, Caren, a math educator, and Lynn, an artist and art educator, use a highly visual approach to show students and teachers the art in math and the math in art. Integrating visual arts into math experiences makes the lessons accessible, engaging, and meaningful for a wide range of students. In each chapter, the authors use everyday objects to create rigorous hands-on activities that address key mathematics standards and concepts. Each lesson provides an introduction to the featured object that explains how it connects to key mathematical concepts, a discussion of the artist's art styles and techniques, featured activities organized by grade level and math content area, the basic materials required to prepare and teach each lesson, a clear picture of what the lesson will look like in a classroom, and a list of resources. The book and its accompanying CD feature a wonderful gallery of images including art photos and student work, and a collection of links to art education organizations, museums, and Web sites that focus on the work of forty major artists.

Logic Circuit Design Shimon P. Vingron, 2012-03-30 In three main divisions the book covers combinational circuits latches and asynchronous sequential circuits Combinational circuits have no memorising ability while sequential circuits have such an ability to various degrees Latches are the simplest sequential circuits ones with the shortest memory The presentation is decidedly non standard The design of combinational circuits is discussed in an orthodox manner using normal forms and in an unorthodox manner using set theoretical evaluation formulas relying heavily on Karnaugh maps The latter approach allows for a new design technique called composition Latches are covered very extensively Their memory functions are expressed mathematically in a time independent manner allowing the use of normal non temporal Boolean logic in their calculation The theory of latches is then used as the basis for calculating asynchronous circuits Asynchronous circuits are specified in a tree representation each internal node of the tree representing an internal latch of the circuit the latches specified by the tree itself The tree specification allows solutions of formidable problems such as algorithmic state assignment finding equivalent states non recursively and verifying asynchronous circuits
