Artificial Neural Networks for Intelligent Manufacturing C.H. Dagli, 2012-12-06 The quest for building systems that can function automatically has attracted a lot of attention over the centuries and created continuous research activities As users of these systems we have never been satisfied and demand more from the artifacts that are designed and manufactured The current trend is to build autonomous systems that can adapt to changes in their environment While there is a lot to be done before we reach this point it is not possible to separate manufacturing systems from this trend The desire to achieve fully automated manufacturing systems is here to stay Manufacturing systems of the twenty first century will demand more flexibility in product design process planning scheduling and process control This may well be achieved through integrated software and hardware architectures that generate current decisions based on information collected from manufacturing systems environment and execute these decisions by converting them into signals transferred through communication network Manufacturing technology has not yet reached this state However the urge for achieving this goal is transferred into the term Intelligent Systems that we started to use more in late 1980s Knowledge based systems our first efforts in this endeavor were not sufficient to generate the Intelligence required our quest still continues Artificial neural network technology is becoming an integral part of intelligent manufacturing systems and will have a profound impact on the design of autonomous engineering systems over the next few years

Computational Modeling Charles S. Taber, Richard J. Timpone, 1996-03-21 Computational modelling allows researchers to combine the rich detail of qualitative research with the rigour of quantitative and formal research as well as to represent complex structures and processes within a theoretical model After an introduction to modelling the authors discuss the role of computational methods in the social sciences They treat computational methods including dynamic simulation knowledge based models and machine learning as a single broad class of research tools and develop a framework for incorporating them within established traditions of social science research They provide a concise description of each method and a variety of social science illustrations including four detailed examples

Self-Organizing Natural Intelligence Myrna Estep, 2006-12-26 Self Organizing Natural Intelligence brings new scientific methods to intelligence research that is currently under the influence of largely classical 19th century single causal theory and method This out dated classical approach has resulted in the single capacity g theory a central processor top down genetically determined linguistic view of intelligence that is directly contradicted by empirical facts of human and animal studies of

intelligence This book proposes utilizes and demonstrates the research superiority of a highly developed multidisciplinary theory models approach to intelligence With conceptual tools concepts and mathematical methods more suited to continuous dynamic phenomena of living things the entire scope of natural intelligence based upon empirical studies of actual human and animal experience is addressed Results show that human and animal intelligence is largely self organizing and emergent across a spectrum of major categories of kinds of natural intelligence not limited to a single top down capacity as current proponents of the single capacity g theory and IQ approach support Contrary to the single capacity verbal theory of intelligence this work argues and shows evidence for three major categories of natural intelligence Overwhelming empirical evidence is given to show that our understanding of cognition itself must be broadened to include nonverbal immediate awareness as a category of natural intelligence that is embedded within sensory and somatosensory motor processes that make possible yet another category of intelligence knowing how While most current theories of intelligence assume that the mind is entirely computational and also assume that sensation is cognitively neutral having no intentionality here empirical evidence is presented from numerous clinical studies showing that certain primitive sensory processes are not cognitively neutral nor do they require a representational language interface in order to be accessible to cognitive intelligence processes This volume describes a rigorous treatment and exhaustive classification of natural intelligence while also demonstrating a more adequate scientific and mathematical approach than current statistical and psychometric approaches shoring up the out dated and misused IQ hypothetical construct

Proceedings, Third Workshop on Neural Networks Society for Computer Simulation, 1993 *Frontiers in Social Dilemmas Research* Wim B.G. Liebrand, David M. Messick, 2012-12-06 Social dilemmas are situations in which individuals groups or nations face a choice between their own short term interests and the longer term interests of all parties involved including themselves As a consequence in the end they all regret the way they have acted Examples of social dilemmas are easy to find depletion of vital resources arms races over production of hazardous substances and environmental pollutants information hoarding and the failure to provide and maintain public goods Understanding the dynamics of social dilemmas constitutes a major challenge One prominent feature that distinguishes this book is the focus on computer simulations as a methodology for the exploration of the dynamic interplay of individual level processes and aggregate outcomes
