MEMS and Microstructures in Aerospace Applications Robert Osiander, M. Ann Garrison Darrin, John L. Champion, 2018-10-03

The promise of MEMS for aerospace applications has been germinating for years and current advances bring the field to the very cusp of fruition. Reliability is chief among the challenges limiting the deployment of MEMS technologies in space as the requirement of zero failure during the mission is quite stringent for this burgeoning field. MEMS and Microstructures in Aerospace Applications provides all the necessary tools to overcome these obstacles and take MEMS from the lab bench to beyond the exosphere. The book begins with an overview of MEMS development and provides several demonstrations of past and current examples of MEMS in space. From this platform the discussion builds to fabrication technologies, the effect of space environmental factors on MEMS devices and micro technologies for space systems instrumentation, communications, thermal control, guidance, navigation and control and propulsion. Subsequent chapters explore factors common to all of the described systems such as MEMS packaging, handling and contamination control, material selection for specific applications, reliability practices for design and application and assurance practices. Edited and contributed by an outstanding team of leading experts from industry, academia and national laboratories, MEMS and Microstructures in Aerospace Applications illuminates the path toward qualifying and integrating MEMS devices and instruments into future space missions and developing innovative satellite systems.

Smart Sensors and Sensing Technology Gourab Sen Gupta, 2008-07-01

Technological advancements in recent years have enabled the development of tiny, cheap, disposable and self-contained battery-powered computers known as sensor nodes or motes which can accept input from an attached sensor, process this input and transmit the results wirelessly to some interested device. When a number of these nodes work together conceivably up to hundreds of thousands, a Wireless Sensor Network (WSN) is formed. Research in the area of wireless sensor networks has become increasingly widespread in recent years, partly due to their wide range of potential uses and also partly due to the fact that the technology enabling such networks is now widely available from many different suppliers such as Crossbow MoteIV, Intel and SUN Java-based motes. These wireless sensor networks have the potential to allow a level of integration between computers and the physical world that to date has been virtually impossible. The uses for such networks is almost limitless and include such diverse applications as a counter-sniper system for urban warfare, 1) tracking the path of a forest fire, 2) determining the structural stability of a building after an earthquake, 3) or tracking people or
