Awwa B112-15 Microfiltration and Ultrafiltration Membrane Systems , **Comparative Evaluation of Ultrafiltration/Microfiltration Membranes for Removal of Nitrocellulose (NC) Fines from Wastewater** Byung Joo Kim,Mark M. Clark,Yonghun Lee,1997 Nitrocellulose NC is a basic constituent for military gun propellants NC wastewater is a byproduct of the NC manufacturing process Crossflow microfiltration ultrafiltration MF UF may recover NC fines and allow the wastewater to be recycled This bench scale crossflow membrane filtration system was constructed to test the application of MF UF technology to NC wastewater This study was conducted in two phases The results of Phase I were used to select a candidate membrane In Phase II a pilot scale crossflow membrane filtration system was constructed to 1 investigate the concentration polarization and fouling mechanism caused by NC fines during crossflow filtration of NC wastewater 2 explore flux decline behavior of NC wastewater streams with various membranes and 3 study the effects of operating parameters on flux decline behavior This study found that 1 UF membranes have a lower flux decline rate and a higher flux recovery than

MF membranes but UF membranes have a relatively low permeate production rate compared to MF membranes 2 A critical membrane pore size of about 0.1 micron exists at which point the worst flux performance occurs 3 The cellulose based hydrophilic membranes have the best flux performance

Microbial Approach of Biofiltration in Industrial Wastewater Treatment for the Sustainability of Environment
Maulin P. Shah,2025-02-04 The ever increasing number of pollutants released into the environment drives the search for new treatment technologies or the modification of existing ones In this sense innovation in biofiltration systems seems promising and therefore a book on the current developments and innovations on its subject is very appropriate Biofiltration is a relatively emerging new technology applied to the treatment of wastewater and other toxic substances Over the past two decades this technology has become an economically viable process for treating the wide variety of unruly pollutants released into the environment For example it is speculated that the US biofiltration market will reach more than 100 million by 2020 This book aims to show how innovation in biofiltration can provide effective solutions to overcome the serious problem of water pollution worldwide The removal of contaminants will result from the combined effects of biological oxidation adsorption and filtration processes Many physicochemical and operational factors influence the performance treatment costs and long term stability of biofilters for wastewater treatment This book focuses on identifying factors that affect biofiltration explains their influence and provides guidelines on how to control these factors to optimize better control over the control of pollutants present in wastewater treatment plants The fundamental basis of treatment in biofilters is the action of microorganisms that degrade pollutants and consequently the book also discusses in depth the microbial ecology of biofiltration
