Kunii, 2012-12-06 In the design of any visual objects the work becomes much easier if previous designs are utilized Computer graphics is becoming increasingly important simply because it greatly helps in utilizing such previous designs Here previous designs signifies both design results and design procedures The objects designed are diverse For engineers these objects could be machines or electronic circuits as discussed in Chap 3 CA CAM Physicians often design models of a patient's organs from computed tomography images prior to surgery or to assist in diagnosis This is the subject of Chap 8 Medical Graphics Chapter 7 Computer Art deals with the way in which artists use computer graphics in creating beautiful visual images In Chap 1 Computational Geometry a firm basis is provided for the definition of shapes in designed objects this is a typical technical area in which computer graphics is constantly making worldwide progress Thus the present volume reflecting international advances in these and other areas of computer graphics provides every potential or actual graphics user with the essential up to date information There are typically two ways of gathering this current information One way is to invite international authorities to write on their areas of specialization Usually this works very well if the areas are sufficiently established that it is possible to judge exactly who knows what Since computer graphics however is still in its developmental stage this method cannot be applied **Recent Advances in Multimedia Signal Processing and Communications**

Mattelart, 2000 In the age of satellites and the Internet worldwide communication has become increasingly unified amid overblown claims about the redemptive possibilities of international networks But this rhetoric is hardly new As Armand Mattelart demonstrates in *Networking the World 1794-2000* globalization and its attendant hype have existed since road and rail were the fastest way to move information Mattelart plates contemporary global communication networks into historical context and shows that the networking of the world began much earlier than many assume in the late eighteenth century He argues that the internationalization of communication was spawned by such Enlightenment ideals as universalism and liberalism and examines how the development of global communications has been inextricably linked to the industrial revolution modern warfare and the emergence of nationalism Throughout Mattelart eloquently argues that discourses of better living through globalization often mask projects of political economic and cultural domination
