Brochard, Vinod Kamath, Julita Corbalán, Scott Holland, Walter Mittelbach, Michael Ott, 2019-08-06 Data centers consume roughly 1% of the total electricity demand while ICT as a whole consumes around 10% Demand is growing exponentially and left unchecked will grow to an estimated increase of 20% or more by 2030 This book covers the energy consumption and minimization of the different data center components when running real workloads taking into account the types of instructions executed by the servers It presents the different air and liquid cooled technologies for servers and data centers

with some real examples including waste heat reuse through adsorption chillers as well as the hardware and software used to measure model and control energy It computes and compares the Power Usage Effectiveness and the Total Cost of Ownership of new and existing data centers with different cooling designs including free cooling and waste heat reuse leading to the Energy Reuse Effectiveness The book concludes by demonstrating how a well designed data center reusing waste heat to produce chilled water can reduce energy consumption by roughly 50% and how renewable energy can be used to create net zero energy data centers

Programming for Hybrid Multi/Manycore MPP Systems John Levesque, Aaron Vose, 2017-10-10 Ask not what your compiler can do for you ask what you can do for your compiler John Levesque Director of Cray s Supercomputing Centers of Excellence The next decade of computationally intense computing lies with more powerful multi manycore nodes where processors share a large memory space These nodes will be the building block for systems that range from a single node workstation up to systems approaching the exaflop regime The node itself will consist of 10 s to 100 s of MIMD multiple instruction multiple data processing units with SIMD single instruction multiple data parallel instructions Since a standard affordable memory architecture will not be able to supply the bandwidth required by these cores new memory organizations will be introduced These new node architectures will represent a significant challenge to application developers Programming for Hybrid Multi Manycore MPP Systems attempts to briefly describe the current state of the art in programming these systems and proposes an approach for developing a performance portable application that can effectively utilize all of these systems from a single application The book starts with a strategy for optimizing an application for multi manycore architectures It then looks at the three typical architectures covering their advantages and disadvantages The next section of the book explores the other important component of the target the compiler The compiler will ultimately convert the input language to executable code on the target and the book explores how to make the compiler do what we want The book then talks about gathering runtime statistics from running the application on the important problem sets previously discussed How best to utilize available memory bandwidth and virtualization is covered next along with hybridization of a program The last part of the book includes several major applications and examines future hardware advancements and how the application developer may prepare for those advancements

Membrane Computing Models: Implementations Gexiang Zhang,Mario J. Pérez-Jiménez,Agustín Riscos-Núñez,Sergey Verlan,Savas Konur,Thomas Hinze,Marian Gheorghe,2021-07-01 The theoretical basis of membrane computing was established in the early 2000s with fundamental research into the computational power complexity aspects

and relationships with other unconventional computing paradigms Although this core theoretical research has continued to grow rapidly and vigorously another area of investigation has since been added focusing on the applications of this model in many areas most prominently in systems and synthetic biology engineering optimization power system fault diagnosis and mobile robot controller design The further development of these applications and their broad adoption by other researchers as well as the expansion of the membrane computing modelling paradigm to other applications call for a set of robust efficient reliable and easy to use tools supporting the most significant membrane computing models This work provides comprehensive descriptions of such tools making it a valuable resource for anyone interested in membrane computing models
