Networked Control Systems Shiwen Tong, Dianwei Qian, 2021 Networked Control System NCS can be regarded as a special type of control system in which sensors controllers and actuators are connected to a closed loop Media sharing characteristics time delay data packet dropout and data displacement are inevitable phenomena in such a control system which can greatly degrade the control performance and even make the control system unstable Alleviating these effects has become one of the most attractive research hotspots in the last two decades All the above three problems can be summarized as the time delay issue There are two kinds of time delay compensation strategies one is active compensation and the other is passive compensation For the former prediction is the core idea Selecting the appropriate candidate predicted control action according to the time delay information is a feasible solution For the latter making the system insensitive to delay is a good choice This book covers the design modeling control simulation and application of the networked control system This book addresses some original contributions reporting the latest advances in networked control It aims to gather the latest research on state of the art methods simulations and applications of networked control techniques The editor hopes it can

reveal some tendencies in this research field and benefit readers including professional researchers and students This is an interesting collection of networked control techniques such as data based control tracking control event triggered control formation control etc

Esquivel-Flores, 2018-07-31 This book presents Networked Control System NCS as a particular kind of a real time distributed system RTDS composed of a set of nodes interconnected by a network and able to develop a complete control process It describes important parts of the control process such as sensor and actuator activities which rely on a real time operating system and a real time communication network As the use of common bus network architecture introduces different forms of uncertainties between sensors actuators and controllers several approaches such as reconfigurable systems have been developed to tackle this problem Moreover modeling NCS is a challenging procedure since there are several non linear situations like local saturations uncertain time delays dead zones or local situations it is necessary to deal with The book describes a novel strategy for modelling and control based on a fuzzy control approach and codesign strategies

Networked Control Systems Alberto Bemporad, Maurice Heemels, Mikael Vejdemo-Johansson, 2010-10-14 This book finds its origin in the WIDE PhD School on Networked Control Systems which we organized in July 2009 in Siena Italy Having gathered experts on all the aspects of networked control systems it was a small step to go from the summer school to the book certainly given the enthusiasm of the lecturers at the school We felt that a book collecting overview on the important developments and open problems in the field of networked control systems could stimulate and support future research in this appealing area Given the tremendous current interests in distributed control exploiting wired and wireless communication networks the time seemed to be right for the book that lies now in front of you The goal of the book is to set out the core techniques and tools that are available for the modeling analysis and design of networked control systems Roughly speaking the book consists of three parts The first part presents architectures for distributed control systems and models of wired and wireless communication networks In particular in the first chapter important technological and architectural aspects on distributed control systems are discussed The second chapter provides insight in the behavior of communication channels in terms of delays packet loss and information constraints leading to suitable modeling paradigms for communication networks
