

Basic Cells of the Nervous System

Neuron

- Basic functional cell of nervous system
- Transmits impulses (up to 250 mph)

Parts of a Neuron

- **Dendrite** – receive stimulus and carries it impulses toward the cell body
- **Cell Body** with nucleus – nucleus & most of cytoplasm
- **Axon** – fiber which carries impulses away from cell body
- **Schwann Cells**- cells which produce myelin or fat layer in the Peripheral Nervous System
- **Myelin sheath** – dense lipid layer which insulates the axon – makes the axon look gray
- **Node of Ranvier** – gaps or nodes in the myelin sheath
- Impulses travel **from dendrite to cell body to axon**

Three types of Neurons

- **Sensory neurons** – bring messages to CNS
- **Motor neurons** - carry messages from CNS
- **Interneurons** – between sensory & motor neurons in the CNS

Impulses

- A **stimulus** is a change in the environment with sufficient strength to initiate a response.
- **Excitability** is the ability of a neuron to respond to the stimulus and convert it into a nerve impulse
- **All of Nothing Rule** – The stimulus is either strong enough to start and impulse or nothing happens
- Impulses are always the **same strength along a given neuron** and they are **self-propagation** – once it starts it continues to the end of the neuron in only one direction- **from dendrite to cell body to axon**
- The nerve impulse causes a movement of ions across the cell membrane of the nerve cell.

Synapse

- **Synapse** - small gap or space between the axon of one neuron and the dendrite of another - **the neurons do not actually touch at the synapse**
- It is junction between neurons which uses neurotransmitters to start the impulse in the second neuron or an effector (muscle or gland)
- The synapse insures one-way transmission of impulses

Neurotransmitters

Neurotransmitters – Chemicals in the junction which allow impulses to be started in the second neuron

Chemicals called neurotransmitters cross a gap in the synapse and continue the nerve impulse.

Four Questions on Visual Self-recognition David Butler,2015-10-19 Whether we like to admit it or not most of us care about our own appearance we spend some of each day in front of mirrors invest our hard earned money on grooming ourselves for both business and pleasure and are increasingly prone to taking selfies The basis of such behaviours is self recognition the process of identifying our own physical appearance Over the last 200 years this seemingly mundane ability has become increasingly subject to investigation by social scientists who are attempting to tease out some of

its associated complexities How do we recognize ourselves Does it involve self awareness When does it develop Which species do and do not show self recognition How does the brain perform self recognition What is the evolutionary value if any of self recognition Very few clear cut answers exist for these questions perhaps most problematic is the absence of consensus about how the brain underlies self recognition This book provides a broad multidisciplinary theoretical framework and an extensive overview concerning these issues which in conjunction with the advocacy and execution of novel experimental paradigms ultimately offers researchers an example of how to further clarify our understanding not only for the neural basis of self recognition but also its development mechanisms and function *Pediatric Board Study Guide* Osama
