

Figure 5. Graph and its Incidence Matrix.

The Incidence Matrix, of a graph, G with V vertices may be defined as $|V|$ by $|E|$ matrix, $A = a_{ij}$, where entries are chosen such that the entry, $a_{ij} = 1$ if its vertex is joined by an edge to its vertex, in G , and 0 if otherwise. (Nikseri, et al. 1981). Other criteria (Ahuja 1982; Koryukhin 1970; Kallman 1974) for generating the graph matrix may also apply. The Adjacency Matrix is a veritable tool in the development of simple solution approaches to network problems.

2. Application of Graph Theory to Network Problems

The graph concepts allow for the configuration of some into a network and the reconfiguration of the existing network into minimum cost or more suitable structure (Ahuja 1982; Saward 1987; Lawry 2002). It may also permit the decomposition of networks into subsystems for better and easier analysis. In practical terms the structures as involved are known as network topologies. These network topologies may change with time via addition or subtraction of nodes or links to allow for determination of suitable information routes or implementation of flow control. Furthermore changes may occur on account of temporary failure of some nodes or due to link congestion (Ahuja 1982). Various algorithms have therefore been developed to serve as tools for appropriately defining network topologies depending on the specific problem objectives. These include minimal spanning tree, shortest – route algorithm, maximum flow algorithm, minimum – cost capacitated network algorithm. Application of these methods has been reported widely and may be found in the works of Wayne (1999), Taha (2006) and Hendry (2004) for transportation, foreign exchange/multinational tax planning networks, Noutari et al. (1981) for computerized facility layout etc.

2.1 Telecommunication Network Case Study

A typical telecommunication system (Hendry 2004), used for linking some oil and gas operational centres is illustrated in Figure 6. It consists of a set of nodes which are the equipment such as radios, dispatchers, multiplexers, PAIX, switches, bridges etc and edges which are links used for voice or data communications. The designed link capacities are as given on the left hand side column of the matrix where the nodes 1, 2 and 3 are terminal concentrations. Figure 7, emphasizes the operational topology of the network for the connections at node 1 in which possible loops 1,4,5,1; 1,8,9,1 and 1,2,3,1 are indicated. Such loops are capable of causing information recycle resulting in inefficient operation of the network. Figure 8 further shows the architecture of the base case network where all the nodes are interconnected and the distances between the nodes are as indicated on the edges.

The objective of this paper, was to carry out performance analysis of the base case telecommunication network and derive from synthetic topology for the network which shall be the least prone to failure.

2.2 Performing the Analysis

It is always the desire of System designers /analysts to derive or select the most effective architecture or design constraints which drive a system to maximum performance. Network performance is concerned with measuring or estimating the parameters that represent

the network behavior which in most cases is the benchmark, of what a system is capable of doing. The parameters of general interest are the network delays, throughput, link utilization etc. These parameters can consequently be measured in terms of transmission efficiency / reliability and operational cost of the network topology (Larson et al. 2006; Ekpenyong et al. 2009).

Computer Network Architectures and Protocols Carl A. Sunshine, 2013-06-29 This is a book about the bricks and mortar from which are built those edifices that will permeate the emerging information society of the future computer networks For many years such computer networks have played an indirect role in our daily lives as the hidden servants of banks airlines and stores Now they are becoming more visible as they enter our offices and homes and directly become part of our work entertainment and daily living The study of how computer networks function is a combined study of communication theory and computer science two disciplines appearing to have very little in common The modern communication scientist wishing to work in this area soon finds that solving the traditional problems of transmission modulation noise immunity and error bounds in getting the signal from one point to another is just the beginning of the challenge The communication must be in the right form to be routed properly to be handled without congestion and to be understood at various points in the network As for the computer scientist he finds that his discipline has also changed The fraction of computers that belong to networks is increasing all the time And for a typical single computer the fraction of its execution load storage occupancy and system management problems that are involved with being part of a network is also growing
