**Roles, Trust, and Reputation in Social Media Knowledge Markets** Elisa Bertino, Sorin Adam Matei, 2014-09-02 Knowledge and expertise especially of the kind that can shape public opinion have been traditionally the domain of individuals holding degrees awarded by higher learning institutions or occupying formal positions in notable organizations Expertise is validated by reputations established in an institutionalized marketplace of ideas with a limited number of available seats and a stringent process of selection and retention of names ideas topics and facts of interest However the social media revolution which has enabled over two billion Internet users not only to consume but also to produce information and knowledge has

created a secondary and very active informal marketplace of ideas and knowledge Anchored by platforms like Wikipedia YouTube Facebook and Twitter this informal marketplace has low barriers to entry and has become a gigantic and potentially questionable knowledge resource for the public at large Roles Trust and Reputation in Social Media Knowledge Markets will discuss some of the emerging trends in defining measuring and operationalizing reputation as a new and essential component of the knowledge that is generated and consumed online The book will propose a future research agenda related to these issues The ultimate goal of research agenda being to shape the next generation of theoretical and analytic strategies needed for understanding how knowledge markets are influenced by social interactions and reputations built around functional roles The authors including leading scholars and young innovators will share with the readers some of the main lessons they have learned from their own work in these areas and will discuss the issues topics and sub areas that they find under studied or that promise the greatest intellectual payoff in the future The discussion will be placed in the context of social network analysis and big data research Roles Trust and Reputation in Social Media Knowledge Markets exposes issues that have not been satisfactorily dealt with in the current literature as the research agenda in reputation and authorship is still emerging In a broader sense the volume aims to change the way in which knowledge generation in social media spaces is understood and utilized The tools theories and methodologies proposed by the contributors offer concrete avenues for developing the next generation of research strategies and applications that will help tomorrow s information consumers make smarter choices developers to create new tools and researchers to launch new research programs

desarrollo de políticas y la toma de decisión que afectan a Internet Por otro lado los usuarios también tienen un rol activo en la Red contribuyen a su desarrollo y o se benefician de ste y tienden a considerarla como un bien público global Finalmente la comunidad técnica protagonista del desarrollo inicial de Internet ha manifestado en numerosas ocasiones que cualquier ejercicio de control por parte de los gobiernos ralentizar a el proceso de innovación e impondr a restricciones en los derechos y libertades individuales y aboga por una autogobernanza en la que los gobiernos puedan participar pero no controlar

**Diffusion of Innovations** Everett M. Rogers,2012 Getting an innovation adopted is difficult a common problem is increasing the rate of its diffusion Diffusion is the communication of an innovation through certain channels over time among members of a social system It is a communication whose messages are concerned with new ideas it is a process where participants create and share information to achieve a mutual understanding Initial chapters of the book

discuss the history of diffusion research some major criticisms of diffusion research and the meta research procedures used in the book This text is the third edition of this well respected work The first edition was published in 1962 and the fifth edition in 2003 The book s theoretical framework relies on the concepts of information and uncertainty Uncertainty is the degree to which alternatives are perceived with respect to an event and the relative probabilities of these alternatives uncertainty implies a lack of predictability and motivates an individual to seek information A technological innovation embodies information thus reducing uncertainty Information affects uncertainty in a situation where a choice exists among alternatives information about a technological innovation can be software information or innovation evaluation information An innovation is an idea practice or object that is perceived as new by an individual or an other unit of adoption innovation presents an individual or organization with a new alternative s or new means of solving problems Whether new alternatives are superior is not precisely known by problem solvers Thus people seek new information Information about new ideas is exchanged through a process of convergence involving interpersonal networks Thus diffusion of innovations is a social process that communicates perceived information about a new idea it produces an alteration in the structure and function of a social system producing social consequences Diffusion has four elements 1 an innovation that is perceived as new 2 communication channels 3 time and 4 a social system members jointly solving to accomplish a common goal Diffusion systems can be centralized or decentralized The innovation development process has five steps passing from recognition of a need through R 2 persuasion to form an attitude 3 decision 4 implementation and 5 confirmation reinforcement or rejection Innovations can also be re invented changed or modified by the user The innovation decision period is the time required to pass through the innovation decision process Rates of adoption of an innovation depend on and can be predicted by how its characteristics are perceived in terms of relative advantage compatibility complexity trialability and observability The diffusion effect is the increasing cumulative pressure from interpersonal networks to adopt or reject an innovation Overadoption is an innovation s adoption when experts suggest its rejection Diffusion networks convey innovation evaluation information to decrease uncertainty about an idea s use The heart of the diffusion process is the modeling and imitation by potential adopters of their network partners who have adopted already Change agents influence innovation decisions in a direction deemed desirable Opinion leadership is the degree individuals influence others attitudes

**Modeling Information Diffusion in Online Social Networks with Partial Differential Equations** Haiyan Wang, Feng Wang, Kuai Xu, 2020-03-16 The book lies at the interface of mathematics social media analysis and data science Its authors aim to introduce a new dynamic modeling approach to the use of partial differential equations for describing information diffusion over online social networks The eigenvalues and eigenvectors of the Laplacian matrix for the underlying social network are used to find communities clusters of online users

Once these clusters are embedded in a Euclidean space the mathematical models which are reaction diffusion equations are developed based on intuitive social distances between clusters within the Euclidean space The models are validated with data from major social media such as Twitter In addition mathematical analysis of these models is applied revealing insights into information flow on social media Two applications with geocoded Twitter data are included in the book one describing the social movement in Twitter during the Egyptian revolution in 2011 and another predicting influenza prevalence The new approach advocates a paradigm shift for modeling information diffusion in online social networks and lays the theoretical groundwork for many spatio temporal modeling problems in the big data era      **Innovation Diffusion** Lawrence A.

Brown,1981-01-01      **Information and Influence Propagation in Social Networks** Wei Chen,Carlos Castillo,Laks V.S. Lakshmanan,2022-05-31 Research on social networks has exploded over the last decade To a large extent this has been fueled by the spectacular growth of social media and online social networking sites which continue growing at a very fast pace as well as by the increasing availability of very large social network datasets for purposes of research A rich body of this research has been devoted to the analysis of the propagation of information influence innovations infections practices and customs through networks Can we build models to explain the way these propagations occur How can we validate our models against any available real datasets consisting of a social network and propagation traces that occurred in the past These are just some questions studied by researchers in this area Information propagation models find applications in viral marketing outbreak detection finding key blog posts to read in order to catch important stories finding leaders or trendsetters information feed ranking etc A number of algorithmic problems arising in these applications have been abstracted and studied extensively by researchers under the garb of influence maximization This book starts with a detailed description of well established diffusion models including the independent cascade model and the linear threshold model that have been successful at explaining propagation phenomena We describe their properties as well as numerous extensions to them introducing aspects such as competition budget and time criticality among many others We delve deep into the key problem of influence maximization which selects key individuals to activate in order to influence a large fraction of a network Influence maximization in classic diffusion models including both the independent cascade and the linear threshold models is computationally intractable more precisely P hard and we describe several approximation algorithms and scalable heuristics that have been proposed in the literature Finally we also deal with key issues that need to be tackled in order to turn this research into practice such as learning the strength with which individuals in a network influence each other as well as the practical aspects of this research including the availability of datasets and software tools for facilitating research We conclude with a discussion of various research problems that remain open both from a technical perspective and from the viewpoint of transferring the results of research into industry strength applications      *Social Structure and the Diffusion of Innovations* Pasqual Dean Chavers,1976      **Diffusion in Social Networks** Paulo Shakarian,Abhivav Bhatnagar,Ashkan

Aleali, Elham Shaabani, Ruocheng Guo, 2015 This book presents the leading models of social network diffusion that are used to demonstrate the spread of disease ideas and behavior It introduces diffusion models from the fields of computer science independent cascade and linear threshold sociology tipping models physics voter models biology evolutionary models and epidemiology SIR SIS and related models A variety of properties and problems related to these models are discussed including identifying seeds sets to initiate diffusion game theoretic problems predicting diffusion events and more The book explores numerous connections between social network diffusion research and artificial intelligence through topics such as agent based modeling logic programming game theory learning and data mining The book also surveys key empirical results in social network diffusion and reviews the classic and cutting edge research with a focus on open problems Diffusion Models for Computer-Communication Networks Jose Heredia Barbera, MASSACHUSETTS INST OF TECH CAMBRIDGE ELECTRONIC SYSTEMS LAB., 1976 The diffusion theory is used to model a computer communication network in which messages flow from one computer center to another The idea is to approximate the various queueing processes that occur in the system of discrete nature themselves as continuous state processes The messages waiting at the queues to be transmitted are considered of small duration so that in the limit the flow of messages is continuous With these ideas a general model for routing of messages in a computer network is established and expressions for the diffusion parameters drift and covariance per unit time are derived in terms of the network traffic The mean length of the queues can thus be calculated and procedures to minimize the system overall queue size may be applied Examples for simple networks are shown One of them corresponds to a load sharing computer system and it is indicated how the general diffusion methods derived earlier for message routing can be used Finally a comparison is made between the expressions obtained by diffusion techniques and those corresponding to the classical exponential M M l queue Author
