contributions of the thesis are 1 an event model ontology targeted at supporting CEP 2 a model for representing parameterized RSP queries as reusable templates and 3 an architecture that allows RSP systems to be integrated for use in CEP The proposed event model tackles issues specifically related to event modeling in CEP that have not been sufficiently covered by other event models includes support for event encapsulation and event payloads and can easily be extended to fit specific use cases The model for representing RSP query templates was designed as an extension to SPIN a vocabulary that supports modeling of SPARQL queries as RDF The extended model supports the current version of the RSP Query Language RSP QL developed by the RDF Stream Processing Community Group along with some of the most popular RSP query languages Finally the proposed architecture views RSP queries as individual event processing agents in a more general CEP framework Additional event processing components can be integrated to provide support for operations that are not supported in RSP or to provide more efficient processing for specific tasks We demonstrate the architecture in implementations for scenarios related to traffic incident monitoring criminal activity monitoring and electronic healthcare monitoring
