study of portfolio optimization and derivative valuation the second half A course in multivariable calculus is not required The material in the first two chapters should go a long way toward helping students prepare for the Financial Mathematics FM actuarial exam Also the discrete material will reveal how beneficial it is for the students to know more about loans in their personal financial lives The notable changes and updates to this edition are itemized in the Preface but overall the presentation has been made more efficient One example is the chapter on discrete probability which is rather unique in its emphasis on giving the deterministic problems studied earlier a probabilistic context The section on Markov chains which is not essential to the development has been scaled down Sample spaces and probability measures random variables and distributions expectation conditional probability independence and estimation all follow Optimal portfolio selection coverage is reorganized and the section on the practicalities of stock transactions has been revised Market portfolio and Capital Market Theory coverage is expanded New sections on Swaps and Value at Risk have been added This book like the first edition was written so that the print edition could stand alone At times we simplify complicated algebraic expressions or solve systems of linear equations or numerically solve non linear equations Also some attention is given to the use of computer simulation to approximate solutions to problems
