Microreactors for Gas/Liquid Reactions Kristin Hecht, 2014-01-01 The widespread adoption of microreactors has been hindered by a lack of knowledge regarding rules and parameters needed for their design This dissertation deals with the investigation of interfacial area and liquid mass transport in microreactors for gas liquid reactions Observations of a reduction in conversion occurring when changing from a glass laboratory device to a stainless steel process device motivated investigations into the effect of material and surface properties on the gas liquid flow and reaction This work takes a look inside the machined microstructures produced at the Institute for Micro Process Engineering of the Karlsruhe Institute of Technology and investigates the nature of the solid surfaces resulting from the

machining process the surface roughness and the contact angle of the resulting surface The effect of wettability on gas liquid flow in microreactors has been investigated in capillaries of various materials The absorption of carbon dioxide into aqueous solutions of sodium hydroxide has been used to investigate gas liquid flow and reaction in capillaries and in a microstructured falling film reactor Under certain limiting assumptions depending upon the exact rates of reaction and transport values of the interfacial area and liquid mass transport coefficient can be derived from measurements of reaction This dissertation contributes a small step towards a better understanding of how measurements of the interfacial area and mass transfer coefficient can be performed demonstrates why the effect of material wettability cannot be ignored and provides a stronger basis for further work in the development of general correlations describing microstructured gas liquid reactors *Chemical Reactions and Processes Under Flow Conditions* Santiago V. Luis, Eduardo García-Verdugo, 2010

Pharmaceutical and fine chemical products are typically synthesised batchwise which is an anomaly since batch processes have a series of practical and economical disadvantages On the contrary flow continuous processes present a series of advantages leading to new ways to synthesise chemical products Flow processes enable control reaction parameters more precisely temperature residence time amount of reagents and solvent etc leading to better reproducibility safer and more reliable processes can be performed more advantageously using immobilized reagents or catalysts improve the selectivity and productivity of the process and possibly even the stability of the catalyst offer opportunities for heat exchange and energy conservation as well as an easy separation and recycling of the reactants and products by adequate process design achieve multistep syntheses by assembling a line of reactors with minimum or no purification in between two reaction steps can be assured by facile automation scale up can be easily conducted by number up With all the new research activity in manufacturing chemical products this comprehensive book is very timely as it summarises the latest trends in organic synthesis It gives an insight into flow continuous processes outlining the basic concepts and explaining the terminology of and systems approach to process design dealing with both homogeneous and heterogeneous catalysis and mini or micro reactors The book contains case studies extensive bibliographies and reference lists in each chapter to enable the reader to grasp the contents and to go on to more detailed texts on specific subjects if desired The book is written by both organic chemists and engineers giving a multidisciplinary vision of the new tools and methodologies in this field It is essential reading for organic chemists in industry or academia working alongside chemical engineers or who want to undertake chemical engineering projects It will also be of interest for chemical engineers to see how basic engineering concepts are applied in modern organic chemistry *Microfabricated Power Generation Devices* Alexander Mitsos, Paul I.
