Neurobiology of Spontaneous Object Exploration in Recognition Memory Owen Chao, Flavio F. Barbosa, Mario Inostroza, Jay-Shake Li, James A. Ainge, 2023-06-01 Animals show a natural tendency to explore novel as opposed to familiar stimuli suggesting an underlying memory process in regard to previously encoded information Dependent on this tendency spontaneous object exploration paradigms have been developed in animals to measure memory processes regarding what an object is where an object is located when an object is present the association of an object and its location in which context an object is shown and an episodic context of the combined what where when components These paradigms feature in the absence of extensive training and reward or aversive incentives analogous to incidental encoding of daily memory The application of these object exploration tests is broad and covers many fields such as behavioral neuroscience psychopharmacology and the neurobiology of recognition memory across species The medial prefrontal cortex parietal cortex and medial temporal lobe the hippocampus entorhinal cortex perirhinal cortex and parahippocampal cortex are the main neuroanatomical structures that

are considered to underlie recognition memory. However, the retrosplenial cortex, insular cortex, anterior thalamus, nucleus reuniens of thalamus, striatum, and amygdala are also considered to play a part. As well, recent findings also indicate that the lateral hypothalamus, interpeduncular nucleus, and cerebellum contribute to recognition memory under certain conditions. Neurotransmitter systems actively mediate and orchestrate the neuronal communication between these structures during the processing of learning and memory. An entire picture of the neuroanatomy and neurobiology of recognition memory will, however, require multidisciplinary approaches of imaging, lesion, pharmacology, optogenetics, chemogenetics, and behavioral studies. Recognition memory deficits are also major symptoms in multiple neuropsychiatric and neurodegenerative disorders such as schizophrenia, attention deficit hyperactivity disorder, depressive disorder, bipolar disorder, autism spectrum disorder, Parkinson's disease, dementia, and Alzheimer's disease. Although the etiology of the shared memory deficits is not fully understood, it may be associated with environmental, pharmacological, and genetic factors that are commonly exposed to these disorders. Spontaneous object exploration paradigms with minimal involvement of emotional valences are appropriate in the study of neuropsychiatric and neurodegenerative disorders as these disorders may sensitize one to emotional stimuli leading to a deficit in recognition memory. Given the impact of these disorders and their memory deficits on our society, there is a strong need to understand the underlying mechanisms and development of innovative pharmaceuticals and gene therapeutics.

Luxury Marketing and Brand Strategy Květa Olšanová, Gina Cook, Marija Zlatić, 2025-09-02. This text provides a comprehensive and strategic overview of luxury marketing and brand management, guiding brands to balance tradition with innovation as they navigate modern challenges and seize opportunities in a rapidly evolving global market. The book explores the core aspects of luxury branding, including the defining traits of luxury brands, the dominance of major luxury groups, and the resilience of independent brands with storied histories.
