Mechanisms of Neurodegeneration in Amyotrophic Lateral Sclerosis and Related Disorders Danyllo Oliveira, Agnes Lumi Nishimura, 2024-12-19 Motor neuron diseases MNDs comprise a large and heterogeneous group of disorders in which the impairment of neuromuscular unity is the major pathological hallmark causing severe morbidity to individuals and frequently leading to death due to respiratory failure The incidence of MNDs varies in different populations however the most prevalent Amyotrophic Lateral Sclerosis is estimated to occur globally in

around 1 2 per 100 000 As of today a myriad of pathogenic variants located at more than a hundred genes and loci have been associated with this complex group of entities Functional studies aiming to understand their physiological impact both using stem cell and animal models have greatly increased the knowledge of pathological mechanisms underlying MNDs These studies show that common pathways such as autophagy protein translation axon elongation vesicular trafficking and RNA metabolism are particularly affected in these conditions and could be potential targets for therapeutic interventions The recent use of antisense oligonucleotides ASOs such as spinraza have successfully decreased the pathological effects of splicing disturbances in Progressive Muscular Atrophy Despite these findings similar results for other motor neuron diseases are still pending
