20 The author has gone for breadth of coverage rather than fine detail and theorems with proof are kept at a minimum The material is not clouded by functional analytic and group theoretical definitions and so is intelligible to readers with a general mathematical background Some of the topics covered are scarcely covered elsewhere Most of the material in Chapters 9 12 16 17 19 and 20 is at postgraduate level and has been influenced by the author's own research interests It has been found that these chapters are especially useful as reference material for senior undergraduate project work The book has a very hands on approach and takes the reader from the basic theory right through to recently published research material

Abstract Compositional Analysis of Iterated Relations Frederic Geurts, 2003-06-26 This self contained monograph is an integrated study of generic systems defined by iterated relations using the two paradigms of abstraction and composition This accommodates the complexity of some state transition systems and improves understanding of complex or chaotic phenomena emerging in some dynamical systems The main insights and results of this work concern a structural form of complexity obtained by composition of simple interacting systems representing opposed attracting behaviors This complexity is expressed in the evolution of composed systems their dynamics and in the relations between their initial and final states the computation they realize The theoretical results are validated by analyzing dynamical and computational properties of low dimensional prototypes of chaotic systems high dimensional spatiotemporally complex systems and formal systems

Competition and Coexistence Ulrich Sommer, Boris Worm, 2012-12-06 The question Why are there so many species has puzzled ecologists for a long time Initially an academic question it has gained practical interest by the recent awareness of global biodiversity loss Species diversity in local ecosystems has always been discussed in relation to the problem of competitive exclusion and the apparent contradiction between the competitive exclusion principle and the overwhelming richness of species found in nature Competition as a mechanism structuring ecological communities has never been uncontroversial Not only its importance but even its existence have been debated On the one extreme some ecologists have taken competition for granted and have used it as an explanation by default if the distribution of a species was more restricted than could be explained by physiology and dispersal history For decades competition has been a core mechanism behind popular concepts like ecological niche succession limiting similarity and character displacement among others For some competition has almost become synonymous with the Darwinian struggle for existence although simple plausibility should tell us that organisms have to struggle against much more than competitors e.g. predators parasites pathogens and environmental harshness
