Membrane Biogenesis Mitochondria Chloroplasts And Bacteria:

Membrane Biogenesis Alexander Tzagoloff, 2012-12-06 There are currently a growing number of laboratories actively studying the mechanism by which various biological membranes are assembled This area of research is still relatively new to biochemists and molecular biologists but in view of the rapid progress being made a review of the field at this time is justified The present volume focuses on the biogenesis of three related membranes Mitochondria and chloroplasts are semiautonomous organelles whose biogenesis is carried out partly in the external cytoplasm and partly by the organelles themselves Both membranes are principally concerned with the energy metabolism of the cell and this commonality of function is reflected in a considerable degree of similarity in their ultrastructure and enzymatic composition Although the bacterial cell membrane is a much more diversified structure it also fulfills the basic energy requirements of the cell and depending on the organism this can take the form of photosynthesis or oxidative phosphorylation The additional consideration that prokaryotic organisms may in fact be the evolutionary ancestors of mitochondria and chloroplasts makes it all the more compelling that those interested in biogenesis be aware of new developments in each of these three areas In organizing this book I felt that the contributors should summarize and bring up to date their own research and review the literature only insofar as would be necessary to provide the proper perspective for their work

Ultrastructure, Macromolecules, and Evolution Lawrence S. Dillon, 2013-11-11 Thus far in the history of biology two and only two fundamental principles have come to light that pervade and unify the entire science the cell theory and the concept of evolution While it is true that recently opened fields of investigation have given rise to several generalizations of wide impact such as the universality of DNA and the energetic dynamics of ecology closer inspection reveals them to be part and parcel of either of the first two mentioned Because in the final analysis energy can act upon an organism solely at the cellular level its effects may be perceived basically to represent one facet of cell metabolism Similarly because the DNA theory centers upon the means by which cells build proteins and reproduce themselves it too proves to be only one more

even though an exciting aspect of the cell theory In fact if the matter is given closer scrutiny evolution itself can be viewed as being a fundamental portion of the cell concept for its effects arise only as a consequence of changes in the cell's genetic apparatus accumulating over geological time Or if one wishes the diametrically opposite standpoint may be taken For if current concepts of the origin of life hold any validity the evolution of precellular organisms from the primordial biochemicals must have proceeded over many eons of time prior to the advent of even the most primitive cell

Chloroplasts J. Reinert, 2013-06-05 Plant cells contain various types of plastid the best known among which is the chloroplast Apart from their predominant interest for the work on photosynthesis however chloroplasts have attracted considerable attention for other reasons This pertains to extranuclear inheritance of cell organelles and particularly important for this series to the participation of chloroplasts as discrete and partly autonomous cell constituents in the developmental biochemistry of plants This volume is composed of articles by investigators who are actively involved in work on various aspects of research on chloroplasts Each author has independently covered and analyzed as comprehensively as possible the particular aspects assigned to him This has the advantage of bringing out many different facets of the situation though some overlapping has to be taken into account We are sure that this volume will enable the reader to gain a broad theoretical and experimental basis for the understanding of the development of chloroplasts and the relationship between plant cells and these organelles

Research in Photobiology A. Castellani, 2012-12-06 Every four years the photobiologists of the world get together in an International Congress They discuss and learn not only research details and findings in their own often narrow fields but educate one another broadly in the many biological systems that interact with light It is this latter purpose that is exemplified by these proceedings the Symposium papers and Workshop summaries of the VIIth International Congress on Photobiology held in Rome August 29 September 3 1976 Photobiology is one of the few true interdisciplinary fields It has an air of excitement about it A glance at the table of contents indicates clearly that photobiology and its practitioners individuals whose primary interests are in medicine plant sciences animal sciences molecular properties and energy
