Olteanu-Raimond,Cidália Costa Fonte,Vyron Antoniou,2017-09-11 Maps are a fundamental resource in a diverse array of applications ranging from everyday activities such as route planning through the legal demarcation of space to scientific studies such as those seeking to understand biodiversity and inform the design of nature reserves for species conservation For a map to have value it should provide an accurate and timely representation of the phenomenon depicted and this can be a challenge in a dynamic world Fortunately mapping activities have benefitted greatly from recent advances in geoinformation technologies Satellite remote sensing for example now offers unparalleled data acquisition and authoritative mapping agencies have developed systems for the routine production of maps in accordance with strict standards Until recently much mapping activity was in the exclusive realm of authoritative agencies but technological development has also allowed the rise of the amateur mapping community The proliferation of inexpensive and highly mobile and location aware devices together with Web 2 0 technology have fostered the emergence of the citizen as a source of data Mapping presently benefits from vast amounts of spatial data as well as people able to provide observations of geographic phenomena which can inform map production revision and evaluation The great potential of these developments is however often limited by concerns The latter span issues from the nature of the citizens through the way data are collected and shared to the quality and trustworthiness of the data This book reports on some of the key issues connected with the use of citizen sensors in mapping It arises from a European Co operation in Science and Technology COST Action which explored issues linked to topics ranging from citizen motivation data acquisition data quality and the use of citizen derived data in the production of maps that rival and sometimes surpass maps arising from authoritative agencies

Evaluation and comparison of Ajax Frameworks regarding applicability, productivity and technical limitations Lukas Ostermaier,2008-03-11

Inhaltsangabe Abstract For some years the Internet has been dominated by phrases like Web 2 0 and Ajax The catchword Web 2 0 which was originally established by O Reilly at the first Web 2 0 conference in October 2004 not only describes a new way of perception and usage of the internet e g social software like blogs wikis etc but also stands for more or less innovative techniques as for instance RSS or Ajax The latter is a combination of techniques that have been available since the late 1990s such as JavaScript asynchronous requests and XML However the term Ajax only exists since Jesse James Garret introduced it in his article in February 2005 Since then Ajax has experienced a real hype Google Mail Google Maps or Flickr just serve as examples for the mass of applications that have to attribute their success substantially to Ajax When it comes to web application development there has also been a lot of progress in the field of Ajax Ajax frameworks of all kinds massively gained popularity and flooded the development community From the biggest companies through to small development teams

almost everyone has published his own Ajax framework or library in the last two years In the meantime there are far more than 150 different frameworks for various programming languages and diverse aims Because of this uncontrolled growth of frameworks it is quite difficult to say which of those is most suitable for a specific project There are two key questions that have to be considered in case of Ajax or Rich Internet Applications RIAs in general How can Ajax significantly increase the business value of an application and how can it be applied productively This thesis mainly focuses on the latter question by evaluating three Ajax frameworks of large companies with a strong background by means of an example application with respect to commercial applicability productivity performance as well as enhancement and adaptation possibilities Furthermore this work discusses the technical limitations and problems of Ajax and provides an outlook on future developments in this area As example application for the evaluation a web based tracking system for public transportation is implemented Each single vehicle is visualized on a street map according to its current position By the implementation of this application with each of the three chosen Ajax frameworks their applicability productivity and performance is illustrated as well as
