This approach prepares the reader for the next generation and future generations of GPUs. The book emphasizes concepts that will remain relevant for a long time rather than concepts that are platform specific. At the same time, the book also provides platform-dependent explanations that are as valuable as generalized GPU concepts. The book consists of three separate parts. It starts by explaining parallelism using CPU multi-threading. In Part I, a few simple programs are used to demonstrate the concept of dividing a large task into multiple parallel sub-tasks and mapping them to CPU threads. Multiple ways of parallelizing the same task are analyzed, and their pros and cons are studied in terms of both core and memory operation. Part II of the book introduces GPU massive parallelism. The same programs are parallelized on multiple Nvidia GPU platforms, and the same performance analysis is repeated. Because the core and memory structures of CPUs and GPUs are different, the results differ in interesting ways. The end goal is to make

programmers aware of all the good ideas as well as the bad ideas so readers can apply the good ideas and avoid the bad ideas in their own programs Part III of the book provides pointer for readers who want to expand their horizons It provides a brief introduction to popular CUDA libraries such as cuBLAS cuFFT NPP and Thrust the OpenCL programming language an overview of GPU programming using other programming languages and API libraries such as Python OpenCV OpenGL and Apple s Swift and Metal and the deep learning library cuDNN

Designing a Modern Skeleton Programming Framework for Parallel and Heterogeneous Systems August Ernstsson, 2020-10-21 Today s society is increasingly software driven and dependent on powerful computer technology Therefore it is important that advancements in the low level processor hardware are made available for exploitation by a growing number of programmers of differing skill level However as we are approaching the end of Moore s law hardware designers are finding

new and increasingly complex ways to increase the accessible processor performance It is getting more and more difficult to effectively target these processing resources without expert knowledge in parallelization heterogeneous computation communication synchronization and so on To ensure that the software side can keep up advanced programming environments and frameworks are needed to bridge the widening gap between hardware and software One such example is the pattern centric skeleton programming model and in particular the SkePU project The work presented in this thesis first redesigns the SkePU framework based on modern C variadic template metaprogramming and state of the art compiler technology It then explores new ways to improve performance by providing new patterns improving the data access locality of existing ones and using both static and dynamic knowledge about program flow The work combines novel ideas with practical evaluation of the approach on several applications The advancements also include the first skeleton API that allows variadic skeletons new data containers and finally an approach to make skeleton programming more customizable without compromising universal portability
