Microscopy and Analysis ,2000 **Selected Papers on Multiphoton Excitation Microscopy** Barry R. Masters,2003

In the last decade multiphoton excitation microscopy has emerged as an important technique with ever increasing numbers of significant applications in the fields of biology chemistry physics and medicine This volume contains key papers on the following topics developments of nonlinear optical spectroscopy and nonlinear scanning microscopy SHG CARS theory and techniques of multiphoton excitation microscopy development of laser sources single molecule studies and applications to biology cell biology embryology and developmental biology neuroscience dermatology and optical biopsy A comprehensive bibliography follows the reprinted papers Business Publication Advertising Source ,2001-08 Encoding Visual Features by Parallel Ganglion Cell Initiated Pathways in the Healthy, Diseased and Artificial Retina Béla Völgyi, Garrett T. Kenyon, David W. Marshak, Botir Sagdullaev, 2019-10-16

Photons are sensed by retinal photoreceptors whose matrix like distribution underlies the transformation of illumination patterns of the visual scene into photoreceptor activity patterns in a visuotopic fashion Activity of neighboring photoreceptors then are compared by secondary bipolar cells to decipher information regarding luminosity and color contrast Bipolar cells achieve this by comparing signals received directly from their center receptive field with those come from spatially offset surrounding receptive field areas mediated by inhibitory sign inverting horizontal cells This information is ultimately sent to retinal ganglion cells the output neurons of the retina In addition to the excitatory bipolar cell inputs spatial and temporal features of ganglion cell activation are robustly modified by inner retinal amacrine cells through inhibitory chemical and or excitatory electrical synaptic inputs Ganglion cells sample various bipolar cell subtypes in their dendritic field and utilize collected inputs to generate a spike output code on luminosity contrast color contrast object motion background motion motion direction changes in background illumination in a subtype specific manner Ganglion cells in each subtype cover the retinal surface economically thus collective information across the population provide a feature pattern and through time a feature movie to the brain Some of these movies are utilized for image perception whereas others are sent to accessory visual brain centers to control eye movement pupil contraction or circadian entrainment A large body of information has been revealed in the past decade regarding this field however much of the details still remain unknown or even enigmatic including i the precise description of neural circuits that serve each ganglion cell subtype to generate a specific feature movie ii the estimation of the number of various ganglion cell subtypes that partake in image forming and non image forming signaling towards the brain iii the description of changes in the inputs morphology and signaling of retinal ganglion cells when the tissue is under stress or undergoes disease related degenerative processes iv the comparison of ganglion cell classes with those of the human retina and finally v the practical use of all the above information to establish retina inspired visual algorithms to suit computer drone and or robotic vision Therefore research articles in this issue were collected to touch upon each of these topics and highlight recent advances of the related

field *Neurodegeneration: From Genetics to Molecules* Victoria Campos-Peña, Marco Antonio Meraz-Ríos, Rosalinda Guevara-Guzmán, Karla Guadalupe Carvajal, 2016-11-15 Chronic degenerative diseases are one of the major public health problems particularly those affecting the nervous system. They are characterized by the degeneration of specific cell populations that include several pathologies which contribute significantly to morbidity and mortality in the elderly population. Therefore, in recent years, the study of neuroscience has gained significant importance. Most of these neurodegenerative disorders are the result of a complex interaction between genetic and environmental factors that generate progression and can even determine its severity. The presence of mutations in genes such as LRRK2, SNCA, PARK7, PARK2, or PINK1 is associated with Parkinson's disease. Mutations in genes such as APP, PS1, and PS2 are associated with familial Alzheimer's disease, while HTT gene mutations are the cause of Huntington's disease. In most cases, this condition is inherited in an autosomal dominant pattern, which means one copy of the altered gene in each cell is sufficient to cause the disorder. It is known that these mutations can also alter the proteins' function; however, it has not yet been possible to fully understand how some genetic changes cause the disease or influence the risk of developing these disorders. Most symptoms seen in these conditions occur when specific nerve cells are damaged or die, generating a loss in brain communication. Also, many of these mutations generate aggregation of intracellular or extracellular proteins, affecting cell function and eventually causing neuronal death. It is unclear whether the presence of these aggregates plays an important role in nerve cell death during the development of neurodegenerative diseases or if they are simply part of the response of cells to the disease. Other mutations affect the mitochondrial function, generating alterations in energy production and promoting the formation of unstable molecules such as free radicals. Under normal conditions, the harmful effects caused by free radicals are offset within the cell. However, in pathological conditions, the presence of mutations can alter this process by allowing the accumulation of radicals and damaging or killing cells. On the other hand, we also know that these diseases may not have a direct genetic component; thus, the study of sporadic type neurodegenerative diseases is much more complex. Histopathological lesions, as well as the cellular and molecular alterations, are generally indistinguishable from familial cases. For this reason, it is important to understand the genetic and molecular mechanisms associated with this type of pathologies. In this sense, this issue aims to understand the molecular processes that occur in the brain and how these are influenced by the environment, genetics, and behavior.
