**High-Linearity CMOS RF Front-End Circuits** Yongwang Ding,Ramesh Harjani,2006-02-08 This book focuses on high performance radio frequency integrated circuits RF IC design in CMOS 1 Development of radio frequency ICs Wireless communications has been advancing rapidly in the past two decades Many high performance systems have been developed such as cellular systems AMPS GSM TDMA CDMA W CDMA etc GPS system global positioning system and WLAN wireless local area network systems The rapid growth of VLSI technology in both digital circuits and analog circuits provides benefits for wireless communication systems Twenty years ago not many people could imagine millions of transistors in a single chip or a complete radio for size of a penny Now not only complete radios have been put in a single chip but also more and more functions have been realized by a single chip and at a much lower price A radio transmits and receives electro magnetic signals through the air The signals are usually transmitted on high frequency carriers For example a typical voice signal requires only 30 KiloHertz bandwidth When it is transmitted by a FM

radio station it is often carried by a frequency in the range of tens of megahertz to hundreds of megahertz. Usually a radio is categorized by its carrier frequency such as 900 MHz radio or 5 GHz radio. In general the higher the carrier frequency the better the directivity but the more difficult the radio design.

**Development of Field Propagation Model for Urban Area** Purnima K Sharma, Dinesh Sharma, R.K. Singh, 2017-03-08 Wireless communication is one of the most dynamic and vibrant areas of technology development in the communication field today. It has been found that severe climatic conditions disturb the propagation of electromagnetic signals at higher frequencies greater than 30 MHz. The disturbance is mainly due to molecular absorption by oxygen for frequencies ranging between 60 and 118 GHz and due to water vapour in 22.183 and 325 GHz bands. Rain and fog has the most significant impact since the size of the rain drops is of the order of the wavelength of the transmitted signal. This results in energy absorption by the rain drops themselves and as a secondary effect energy is scattered by the drops. The frequency selective absorption characteristics of the atmosphere can be approximated by a transfer function. In most of the practical channels when the signal propagates through the atmosphere the effect of many factors on the signal has to be considered along with the free space propagation channel assumption. The main objective of this study is therefore to find out whether and how the different climatic conditions are influencing radio wave propagation in GSM frequency bands in general and in Narnaul Haryana India in particular. To carry out this investigation the records of radio wave propagation along with path loss during different climatic conditions have been analyzed. On the strength of these analyses a propagation path loss model has been developed by proposing suitable correction factors due to different climatic conditions. The validation of this developed path loss model has been verified by taking reference models and by applying practically in different urban areas. The effect of these climatic conditions on the link budget has also been analyzed.
