Relativistic Field Theory for Microwave Engineers Matthew A. Morgan,2024-06-30 This book explores the fundamental but often overlooked connection between Maxwell s equations as they are taught in undergraduate electrical engineering courses and special relativity Written for an audience of practical engineers instead of theoretical physicists it exposes the

underlying contradictions brought about by the emergence of electromagnetic theory one of the greatest triumphs in mathematical physics of all time that unified the phenomena of electricity magnetism and light into a world in which the classical Galilean principle of relativity was considered incontrovertible It explains how Einstein redefined the concepts of space and time and what it means to measure them while altogether disbanding the notion of global simultaneity A manifestly relativistic formulation of electromagnetic laws is first presented and then applied to common engineering problems like the interaction of electromagnetic fields at dynamic interfaces the derivation of propagating modes in closed metal waveguides and the foundations of microwave network theory Mathematical toolkits for relativistic analysis such as tensor notation and spacetime algebra are explained These tools are then used to analyze the consequences of motion at relativistic speeds upon otherwise well known electromagnetic circuit behaviors Well drawn and insightful diagrams along with articulate explanations help the reader to gain an intuitive understanding of four dimensional spacetime and the nature of the electromagnetic field in that context while summary tables and comprehensive appendices serve as a resource for further selfdirected exploration Readers trained in microwave engineering will learn to see their field from a new perspective and shall gain from that new insight the ability to conceive of unexpected solutions to practical engineering problems that might otherwise defy one's intuition

Duplexing for 5G David B. Cruickshank, 2020-05-31 This exciting new book examines the feasibility of using a method of doubling the capacity of cellular networks by simultaneously transmitting and receiving signals at the same frequency a process known as full duplexing FD To realize full duplexing changes in the hardware of the cell base stations relaying equipment hot spot access points and mobile phones are necessary to prevent the hardware's transmitters from interfering with their own receivers This requires looking at how to separate the strong transmitted signal from the very weak received signal a process requiring both hardware analog changes and more complex digital signal processing Different ways of achieving that goal are examined The book reviews the merits of hardware changes involving new duplexing components that may be different depending on the frequency band and cell hardware being used Developing full duplex FD systems in 5G LTE cellular communications and what can be achieved with ferrite based circulators in terms of size reduction and performance enhancement especially at millimetric frequencies is considered The relative merits of ferrite and non ferrite circulators are compared in terms of their fundamental materials and device technologies such as isolation insertion loss bandwidth and non linearity FD in the entire 5G cell is also examined and its resulting range of equipment and device communication This includes front hauling more sophisticated back and front hauling backhaul beam switching and cell extenders and relays all of which could involve FD *Nonlinear Design: FETs and HEMTs* Peter H. Ladbrooke, 2021-11-30

Despite its continuing popularity the so called standard circuit model of compound semiconductor field effect transistors FETs and high electron mobility transistors HEMTs is shown to have a limitation for nonlinear analysis and design it is valid only in the static limit When the voltages and currents are time varying as they must be for these devices to have any practical use the model progressively fails for higher specification circuits This book shows how to reform the standard model to render it fully compliant with the way FETs and HEMTs actually function thus rendering it valid dynamically Proof of principle is demonstrated for several practical circuits including a frequency doubler and amplifiers with demanding performance criteria Methods for extracting both the reformulated model and the standard model are described including a scheme for reconstructing from S parameters the bias dependent dynamic or RF I V characteristics along which devices work in real world applications and as needed for the design of nonlinear circuits using harmonic balance and time domain
