Microscale Testing in Aquatic Toxicology Christian Blaise, Kenneth Lee, P. G. Wells, 1998 **Microscale Testing in Aquatic Toxicology** Peter G. Wells, Kenneth Lee, Christian Blaise, 2018-05-04 Bioassays are among the ecotoxicologists' most effective weapons in the evaluation of water quality and the assessment of ecological impacts of effluents, chemicals discharges and emissions on the aquatic environment. Information on these assessment aids is needed throughout the international scientific and environmental management community. This comprehensive reference provides an excellent overview of the small scale aquatic bioassay techniques and applications currently in use around the world. This special volume is the result of several years of collaboration between Environment Canada and Fisheries and Oceans Canada. Internationally recognized research scientists at many institutions have contributed to this state of the art examination of the exciting environmentally important field of microscale testing in aquatic toxicology. **Microscale Testing in Aquatic Toxicology** contains over forty chapters covering relevant principles, new techniques and recent advancements and applications in scientific research, environmental management, academia and the private sector. **Small-scale Freshwater Toxicity Investigations** Christian Blaise, Jean-François Férard, 2006-01-16 Developed, developing and emerging economies worldwide are collectively contributing multiple stresses on aquatic ecosystems by the release of numerous contaminants. This in turn demands that basic toxicological information on their potential to harm living species be available. Hence, environmental protection programs aimed at preserving water quality must have access to comprehensive toxicity screening tools and strategies that can be applied reliably and universally. While a good number of toxicity testing procedures and hazard assessment approaches have been published in the scientific literature over the past decades, many are wanting in that insufficient detail is available for users to be able to fully understand the test method or scheme and to be able to reproduce it successfully. Even standardized techniques published in recognized international standard organization documents are often lacking in thoroughness and minutiae. Paucity of information relating to biological test methods may be consequent and trigger several phenomena including generation of invalid data and resulting toxicity measurements, erroneous interpretation and decision taking with regards to a particular chemical or environmental issue or simply abandonment of testing procedures. Clearly, improperly documented toxicity testing methods can be detrimental to their promotion and use as they open the doorway to unnecessary debate and criticism as to their rationale. Furthermore, this situation can indirectly contribute to delaying, minimizing or eliminating their application, thereby curtailing the important role toxicity testing plays in the overall protection and conservation of aquatic ecosystems. **New Microbiotests for Routine Toxicity Screening and Biomonitoring** Guido Persoone, Colin Janssen, Wim De Coen, 2012-12-06 The determination of the hazards resulting from the accidental or deliberate contamination of terrestrial and aquatic environments is in most countries still limited to the detection and quantification of the suspected pollutants by chemical analyses. Such an approach is unfortunately hampered

by the following constraints the costs as well as the technical difficulties of analyzing every individual chemical which may be present in the samples and the difficulty of assessing the hazards and risks of environmental contaminations from a set of chemical data During the last decades the scientific and regulatory community has gradually realized that biological methodologies have to be taken into consideration for an ecologically meaningful assessment of the toxicological hazards of contaminants Effect evaluations obtained with biological techniques indeed integrate the impact of all the contaminants to which living biota are exposed Bioassays with selected test species representative for the biological communities of the environments under consideration are now applied more or less regularly to determine toxic and genotoxic effects Taking into account the species specific and chemical specific character of toxicity to biota the necessity of a battery of tests approach with species of different trophic levels is currently also generally accepted and implemented It is clear that a balanced partnership between chemical biological toxicological and microbiological analyses is always the best strategy for generating the broadest information base on environmental hazards

The Utilization of Bioremediation to Reduce Soil Contamination: Problems and Solutions Václav Sasek, John A. Glaser, P. Baveye, 2012-12-06 Traditional reliance on chemical analysis to understand the direction and extent of treatment in a bioremediation process has been found to be inadequate Whereas the goal of bioremediation is toxicity reduction few direct reliable measures of this process are as yet available Another area of intense discussion is the assessment of market forces contributing to the acceptability of bioremediation Finally another important component is a series of lectures and lively exchanges devoted to practical applications of different bioremediation technologies The range of subjects covers a wide spectrum encompassing emerging technologies as well as actual full scale operations Examples discussed include landfarming biopiling composting phytoremediation and mycoremediation Each technology is explored for its utility and capability to provide desired treatment goals Advantages and limitations of each technology are discussed The concept of natural attenuation is also critically evaluated since in some cases where time to remediation is not a significant factor it may be an alternative to active bioremediation operations
