the mainframe type Back then even having just 5 MB of RAM memory in a small computer was a big thing By today s standards the iPhone is lightyears away from this kind of computing technology and in just this one device we perhaps have enough computing power to send the same Saturn V rocket to the moon and back at least 100 times But just think about it all that was needed back then was just this size of memory The concepts of the Cloud virtualization etc were barely even heard of The computers that were designed back then for example had just one specific purpose to process the input and output instructions also known as I O so that the spacecrafts could have a safe journey to the moon land on it and return safely back to Earth once again Because of these limited needs though considered to be rather gargantuan at the time all that was needed was just that small amount of memory But by today s standards given all of the applications that we have today we need at least 1 000 times that much just to run the simplest of Cloud based applications But also back then there was one concept that was not even heard of quite yet Cybersecurity In fact even the term of Cyber was not even heard of Most of the security issues back then revolved around physical security Take for example NASA again The main concern was only letting the authorized and legitimate employees into Mission Control Who would have thought that back then there was even the slightest possibility that a Cyberattacked could literally take over control of the computers and even potentially steer the Saturn V rocket away from its planned trajectory
