## **Microvascular Complications Of Diabetes Ecab:**

**Microvascular Complications of Diabetes - ECAB** V Seshiah, 2009-09-15 The pathogenesis of microvascular complications is complex and multifactorial. Yet hyperglycemia emerges as the most important single cause which has been proved by the Diabetes Control and Complications Trial (DCCT). Thus the importance of protecting the body from hyperglycemia cannot be overstated. The direct and indirect effects on the human vascular tree are the major source of morbidity and mortality in both type 1 and type 2 diabetes. Generally the injurious effects of hyperglycemia are separated into macrovascular complications (coronary artery disease, peripheral arterial disease and stroke) and microvascular complications (diabetic nephropathy, neuropathy and retinopathy). It is important for physicians to understand the relationship between diabetes and vascular disease because the prevalence of diabetes continues to increase in our country and the clinical requirements for primary and secondary prevention of these complications are also expanding. *Microvascular Disorders*

Dakshinamurthy, 2013-07-22 The prevalence of Diabetes Mellitus is increasing rapidly all over the world and more so in the developing countries. The global burden of diabetes is expected to double between 2000 and 2030 with the greatest increases in prevalence occurring in the Middle East, sub-Saharan Africa and India. Moreover, the development of type 2 diabetes during the childbearing years is also likely to increase primarily in the developing countries. It has already been established that Diabetes is the most common primary cause leading to end stage renal disease (ESRD) and Diabetic Nephropathy is the leading cause of chronic kidney disease (CKD) in India. The cornerstones of management of Diabetic Kidney Diseases include early diagnosis of diabetic nephropathy, prevention of its progression and treatment of the co-morbid conditions. Substantial under-diagnosis of both diabetes and chronic kidney disease leads to lost opportunities for prevention. An inadequate or inappropriate care of patients with diabetic kidney disease contributes to disease progression eventually up to a stage that requires renal replacement therapy which is not a feasible option for many on a long term basis especially in a developing country like ours. This book covers various aspects of diabetic kidney disease in detail and attempts to familiarize the reader with the existing aspects of the conditions as well as touch upon the new advances in the field. The first chapter outlines the extent to which the condition affects the population globally as well as in our country. The second chapter explores the underlying mechanism by which the disease starts and progresses and the pathological markers of the same. The third chapter delineates the clinical and diagnostic markers of the condition. The fourth and fifth chapters speak of the non-diabetic glomerular and non-glomerular diseases in diabetics. The sixth chapter addresses the most important and desirable goal of preventing the progression and ideally the onset of the disease. The seventh chapter puts together the various treatment modalities available and the subsequent chapter explores the management options for cases requiring renal replacement. In

addition to the emphasis to Indian literature at the end of each chapter the ninth chapter is specially included to highlight the salient aspects of this condition from the Indian perspective This book will be beneficial not only for the nephrologists but also for the epidemiologists medical students diabetologists and every doctor who deals with diabetes mellitus

**Unconventional Organ Damage in Diabetes - ECAB** Samar Banerjee,2012-09-14 Cell health depends on a steady supply of fuel from glucose and free fatty acids Both these major fuels are regulated by insulin Cells in the muscle liver and fat need insulin to receive glucose and hence do not become exposed to high blood glucose levels when the blood sugars are high and insulin levels are low The lack of insulin slows the movement of glucose into these cells and probably spares them from damage when blood sugars are high However other cells such as those in the brain nervous system heart blood vessels and kidneys pick up glucose directly from the blood without using insulin These cells except the brain are more prone to damage from high blood sugars because they become exposed to high internal levels of glucose This to quite an extent explains why damage tends to occur in specific organs such as in nerve and kidney cells and in small blood vessels like those in the eyes This project on the organ damage in diabetes is an attempt to elaborate on the various factors to be considered in managing these patients the pointers for early diagnosis and prevention of the same

**Hotspots in Diabetes - ECAB** Ambady Ramachandran,2013-07-12 Diabetes is one of the most important non communicable lifestyle diseases Diabetes is a multifaceted disorder which possibly influences and impacts body pathophysiology by different mechanisms and in varied ways Diabetes has a very distinguished impact on cardiovascular system and plays a detrimental role in development of cardiovascular disorders Metabolic memory is used to describe the impact of exposure to glucotoxicity lipotoxicity and other metabolic disturbances either as an adverse or a beneficial cell response which determines the later development of vascular complications Terms such as metabolic imprint legacy effect glycemic memory or latent hyperglycemic damage are also used Diabetes has significant impact on different facets of life Diabetes has a distinguished but significant impact on development of various cancers Diabetes has a positive negative and even neutral impact on pathogenesis and progression of cancer depending upon the tumor site On the contrary cancer also has a significant effect on diabetes development and management These facets tend to get overlooked in the study of diabetes development and management All these aspects are being thoroughly covered in this project so as to facilitate better management of diabetics

**Microvascular and Neurological Complications of Diabetes** G. Crepaldi,1987 Three aspects of diabetes were discussed during the XII Congress of the International Diabetes Federation diabetic retinopathy diabetic nephropathy and diabetic neuropathy This volume presents contributions covering the wide range of physiological changes in patients suffering from diabetes and current knowledge is reported by specialists in the field

*ECAB Clinical Update: Diabetology Diabetic Foot , Vascular Complications of Diabetes* Richard Donnelly,Edward Horton,2008-04-15 Diabetes has reached epidemic proportions and the cardiovascular complications of diabetes are life threatening and disabling This book is unique in providing a simple explanation of the

biochemical role of PKC in diabetes complications which allows clinicians to understand why PKC inhibitors in development are an exciting prospect for future treatment to slow progression of eye foot complications New features of this Second Edition include Updated throughout to reflect the impact of recent major clinical trials on current clinical practice Includes a major new section on diabetic neuropathy Revised section on diabetic retinopathy Each chapter is short and succinct focusing on best practice There are key learning points at the end of each chapter with numerous helpful tables figures and clinical images

*Infections in Diabetes - ECAB* Samar Banerjee,2012-07-05 Patients with diabetes are predisposed to infections The risk ratio for infectious disease related hospitalization for diabetic versus nondiabetic persons is more than 2 and almost 2 for death attributable to infection Infections in diabetes may precipitate metabolic derangements and conversely the metabolic derangements of diabetes may facilitate infection Abnormalities in the microvascular circulation of individuals with diabetes may result in decreased tissue perfusion which facilitates the acquisition of infection and impairs response to therapy The incidence of TB among diabetic patients is 2.5 times higher when compared to the general population which recently has raised the concern that a combination of DM and HIV infection might lead to a further increased incidence of TB in India and in other developing nations However it is unclear whether diabetes is an independent risk for common upper and lower respiratory tract infections Urinary tract is also reported to be the most prevalent site of infection in patients with diabetes These infections are known to account for a relatively smaller percentage of reported patients probably due to the fact that most patients including diabetics with urinary tract infection are treated as outpatients A number of long term effects of diabetes mellitus on the genitourinary system predispose diabetic patients to bacterial urinary tract infections In addition complications of urinary tract infection e.g bacteremia renal abscesses and renal papillary necrosis are more common in patients with than without diabetes Rhinocerebral mucormycosis and emphysematous pyelonephritis are some of the less commonly reported conditions seen in diabetics though being important pathologies The primary goal of this book is to provide a high quality evidence based text on the various aspects of the associations of various infections in diabetics with prime focus on TB and diabetes rare conditions such as rhinocerebral mucormycosis and emphysematous pyelonephritis and also the various acute infections commonly reported in the condition The book includes in depth analysis of the diagnostic and management issues considering the same

**Microvascular Complications in Diabetes** Marianne E. Plater,2002 [Incidence of Microvascular Complications Among Patients with Type 2 Diabetes at a Tertiary Care Hospital](#) Mustafa Nida,2017 Background The development and incidence of microvascular complications of diabetes are strongly related to glycemic control Epidemiologic studies have shown that one fifth of all diabetic subjects suffer from more than one micro vascular complication The complications compromise the quality of life and are also the source of morbidity and mortality Objective To estimate the incidence of microvascular complications among type 2 diabetics at a tertiary care hospital of Karachi Pakistan Methodology This retrospective longitudinal follow up

study assessed the data records of type 2 diabetic subjects who visited the outpatient department of Baqai Institute of Diabetology and Endocrinology from January 2005 to April 2016. Subjects of gestational diabetes, type 1 diabetes, and with history of any microvascular complication at first visit were excluded. Medical records were obtained through electronic database Health Management System. Incidence rates were estimated by different intervals of duration of diabetes, glycemic control (HbA1c 22.647% vs HbA1c 7% and blood pressure control 130/85 mmHg vs 130/85 mmHg). Statistical analyses were conducted using STATA version 14 and SPSS version 20. Results: Out of 4633 patients, 2336 (50.4%) were male and 2297 (49.6%) were female. At baseline, 3175 (85.9%) of the patients had HbA1c level 7% and 1976 (57.2%) were hypertensive while positive family history of diabetes was found in 2419 (69.4%) patients. Incidence rate of microvascular complications was 92.9/130.2 and 106.2 per 1000 person years for retinopathy, neuropathy, and nephropathy respectively. The incidence rate ratio (IRR) shows that all microvascular complications were significantly high among diabetic patients with duration of diabetes 10 years followed by 5-10 years. Incidence of retinopathy and nephropathy was significantly higher in patients who had HbA1c 7% than patients with HbA1c 22.647% (p value < 0.05).

**Microvascular Disease in Diabetes** Francesco Tecilazich, 2020-05-05

**Oral Hypoglycemic Agents - ECAB**  
Abdul Hamid Zargar, 2009-09-25 Even though we have many advances in the development of oral hypoglycemic agents, an ideal drug for treating type 2 diabetes is still a distant reality. Today physicians can choose from a variety of medications

targeting numerous facets of disease but each drug class poses some limitations The age old molecules such as sulfonylureas and biguanides are still valued because of their well studied mode of action safety tolerability and predictable pharmacodynamic effects This book attempts to describe the historical aspects and advances in the arena of oral hypoglycemic agents extended and sustained release formulations of glipizide and metformin both of which have great promise in the treatment of type 2 diabetes mellitus as well as evaluates the role of the group in diabetic foot infections
