

1 multimedia transport across ATM networks

Transmission of multimedia content over a high-speed network such as ATM for applications such as Video on Demand (VoD) is slated to become one of the fastest emerging applications in the real world. Due to the low delay and high QoS (Quality of service) constraint posed by these applications, various issues arise such as selection of AAL (ATM Adaptation Layer), service class selection and others have to be addressed. ATM is characterized by its ability to provide high QoS guarantees to multimedia applications. The classes of service: Constant Bit Rate (CBR), Available Bit rate (ABR), Real time Variable Bit rate (RT -VBR) and Unspecified Bit Rate (UBR) exist in ATM, which can be used to provide the required bit rate for multimedia applications. Video on Demand is a service wherein the video is transported over a network to be played at the customer premises. The VoD system is shown in figure below: Transport of Compressed Video over ATM the issues involving transport of compressed video over ATM are Selection of Service Class Adaptation Layer Selection of Service Class.
