Multistate Analysis Of Life Histories With R Use R:

Multistate Analysis of Life Histories with R Frans Willekens, 2014-09-11 This book provides an introduction to multistate event history analysis. It is an extension of survival analysis in which a single terminal event endpoint is considered and the time to event is studied. Multistate models focus on life histories or trajectories conceptualized as sequences of states and sequences of transitions between states. Life histories are modeled as realizations of continuous time Markov processes. The model parameters transition rates are estimated from data on event counts and populations at risk using the statistical theory of counting processes. The Comprehensive R Network Archive CRAN includes several packages for multistate modeling. This book is about Biograph. The package is designed to enhance exploratory analysis of life histories and to make multistate modeling accessible. The package incorporates utilities that connect to several packages for multistate modeling including survival, eha, Epi, mvna, mstate, msm, and TraMineR for sequence analysis. The book is a hands-on presentation of Biograph and the packages listed. It is written from the perspective of the user. To help the user master the techniques and the software, a single data set is used to illustrate the methods and software. It is the subsample of the German Life History Survey which was also used by Blossfeld and Rohwer in their popular textbook on event history modeling. Another data set, the Netherlands Family and Fertility Survey, is used to illustrate how Biograph can assist in answering questions on life paths of cohorts and individuals. The book is suitable as a textbook for graduate courses on event history analysis and introductory courses on competing risks and multistate models. It may also be used as a self-study book. The R code used in the book is available online. Frans Willekens is affiliated with the Max Planck Institute for Demographic Research MPIDR in Rostock, Germany. He is Emeritus Professor of Demography at the University of Groningen, a Honorary Fellow of the Netherlands Interdisciplinary Demographic Institute NIDI in the Hague, and a Research Associate of the International Institute for Applied Systems Analysis IIASA in Laxenburg, Austria. He is a member of the Royal Netherlands Academy of Arts and Sciences KNAW. He has contributed to the modeling and simulation of life histories mainly in the context of population forecasting.

Multistate Models for the Analysis of Life History Data Richard J. Cook, Jerald F. Lawless, 2018-05-15 Multistate Models for the Analysis of Life History Data provides the first comprehensive treatment of multistate modeling and analysis, including parametric, nonparametric, and semiparametric methods applicable to many types of life history data. Special models such as illness-death, competing risks, and progressive processes are considered, as well as more complex models. The book provides both theoretical development and illustrations of analysis based on data from randomized trials and observational cohort studies in health research. It features a wide range of applications of multistate models. Presents methods for both continuously and intermittently observed life history processes. Gives a thorough discussion of conditionally independent censoring and observation processes. Discusses models with random effects and joint models for two or more multistate processes. Discusses and illustrates software for multistate analysis that is available in R. Target audience includes those

Emerging Topics in Modeling Interval-Censored Survival Data Jianguo Sun, Ding-Geng Chen, 2022-11-29 This book primarily aims to discuss emerging topics in statistical methods and to booster research education and training to advance statistical modeling on interval censored survival data Commonly collected from public health and biomedical research among other sources interval censored survival data can easily be mistaken for typical right censored survival data which can result in erroneous

statistical inference due to the complexity of this type of data. The book invites a group of internationally leading researchers to systematically discuss and explore the historical development of the associated methods and their computational implementations as well as emerging topics related to interval censored data. It covers a variety of topics including univariate interval censored data, multivariate interval censored data, clustered interval censored data, competing risk interval censored data, data with interval censored covariates, interval censored data from electric medical records, and misclassified interval censored data. Researchers, students, and practitioners can directly make use of the state of the art methods covered in the book to tackle their problems in research, education, training, and consultation.

Survival Analysis Prabhanjan Narayanachar Tattar, H J Vaman, 2022-08-26. Survival analysis generally deals with analysis of data arising from clinical trials. Censoring, truncation, and missing data create analytical challenges, and the statistical methods and inference require novel and different approaches for analysis. Statistical properties, essentially asymptotic ones of the estimators and tests, are aptly handled in the counting process framework, which is drawn from the larger arm of stochastic calculus. With explosion of data generation during the past two decades, survival data has also enlarged, assuming a gigantic size. Most statistical methods developed before the millennium were based on a linear approach, even in the face of complex nature of survival data. Nonparametric, nonlinear methods are best envisaged in the Machine Learning school. This book attempts to cover all these aspects in a concise way. Survival Analysis offers an integrated blend of statistical methods and machine learning, useful in analysis of survival data. The purpose of the offering is to give an exposure to the machine learning trends for lifetime data analysis. Features: Classical survival analysis techniques for estimating statistical functional and hypotheses testing. Regression methods covering the popular Cox relative risk regression model, Aalen's additive hazards model, etc. Information criteria to facilitate model selection, including Akaike, Bayes, and Focused Penalized methods. Survival trees and ensemble techniques of bagging, boosting, and random survival forests. A brief exposure of neural networks for survival data. R program illustration throughout the book.

Multi-State Survival Models for Interval-Censored Data Ardo van den Hout, 2016-11-25 Multi State Survival Models for Interval Censored Data introduces methods to describe stochastic processes that consist of transitions between states over time It is targeted at researchers in medical statistics epidemiology demography and social statistics One of the applications in the book is a three state process for dementia and survival in the older population This process is described by an illness death model with a dementia free state a dementia state and a dead state Statistical modelling of a multi state process can investigate potential associations between the risk of moving to the next state and variables such as age gender or education A model can also be used to predict the multi state process The methods are for longitudinal data subject to interval censoring Depending on the definition of a state it is possible that the time of the transition into a state is not observed exactly However when longitudinal data are available the transition time may be known to lie in the time interval defined by two successive observations Such an interval censored observation scheme can be taken into account in the statistical inference Multi state modelling is an elegant combination of statistical inference and the theory of stochastic processes Multi State Survival Models for Interval Censored Data shows that the statistical modelling is versatile and allows for a wide range of applications

Models for Multi-State Survival Data Per Kragh Andersen, Henrik Ravn, 2023-10-11 Multi state models provide a statistical framework for studying longitudinal data on subjects when focus is on the occurrence of events that the subjects may experience over time They find application particularly in biostatistics medicine and public health The book includes mathematical detail which can be skipped by readers more interested in the practical examples It is aimed at biostatisticians and at readers with an interest in the topic having a more applied background such as epidemiology This book builds on several courses the authors have taught on the subject Key Features Intensity based and marginal models Survival data competing risks illness death models recurrent events Includes a full chapter on pseudo values Intuitive introductions and mathematical details Practical examples of event history data Exercises Software code in R and SAS and the data used in the book as well as solutions to the exercises can be found on the book's webpage <https://multi-state-book.github.io/companion>
