A Remarkable Collection of Babylonian Mathematical Texts Jöran Friberg,2007-10-01 The sub collection of

mathematical cuneiform texts in the Sch yen Collection makes a substantial addition to the known corpus of such texts It contains 121 texts not counting 151 multiplication tables and 53 small weight stones According to the catalog at the end of the Index of Subjects below where those 121 mathematical texts are ordered by content nearly all known kinds and some new kinds of mathematical cuneiform texts are represented in the collection Therefore it has been possible to organize the present work as a broad general account of Mesopotamian mathematics illustrated mainly by texts from the Sch yen Collection but occasionally also by previously published texts The general disposition of the book is borrowed from my own concise but comprehensive survey of Mesopotamian mathematics in the article on Mathematics in *Reallexikon der Assyriologie* vol 7 1990 My ambition has been to make the account easily accessible to all kinds of readers yet still as detailed and exhaustive as possible For that purpose there is for instance an introductory Chapter 0 on how to get a better understanding of mathematical cuneiform texts The chapter begins with a discussion of the danger of unintentional anachronisms in translations of pre Greek mathematical texts and continues with a presentation of the kind of conform transliterations translations and interpretations true to the original that will be used throughout the book in discussions of individual texts

*The Exact Sciences in Antiquity* Otto Neugebauer, 1969-01-01 Based on a series of lectures delivered at Cornell University in the fall of 1949 and since revised this is the standard non technical coverage of Egyptian and Babylonian mathematics and astronomy and their transmission to the Hellenistic world Entirely modern in its data and conclusions it reveals the surprising sophistication of certain areas of early science particularly Babylonian mathematics After a discussion of the number systems used in the ancient Near East contrasting the Egyptian method of additive computations with unit

fractions and Babylonian place values Dr Neugebauer covers Babylonian tables for numerical computation approximations of the square root of 2 with implications that the Pythagorean Theorem was known more than a thousand years before Pythagoras Pythagorean numbers quadratic equations with two unknowns special cases of logarithms and various other algebraic and geometric cases Babylonian strength in algebraic and numerical work reveals a level of mathematical development in many aspects comparable to the mathematics of the early Renaissance in Europe This is in contrast to the relatively primitive Egyptian mathematics In the realm of astronomy too Dr Neugebauer describes an unexpected sophistication which is interpreted less as the result of millennia of observations as used to be the interpretation than as a competent mathematical apparatus The transmission of this early science and its further development in Hellenistic times is also described An Appendix discusses certain aspects of Greek astronomy and the indebtedness of the Copernican system to Ptolemaic and Islamic methods Dr Neugebauer has long enjoyed an international reputation as one of the foremost workers in the area of premodern science Many of his discoveries have revolutionized earlier understandings In this volume he presents a non technical survey with much material unique on this level which can be read with great profit by all interested in the history of science or history of culture 14 plates 52 figures
