Clinical Pathways in Stroke Rehabilitation Thomas Platz, 2021-01-14 This open access book focuses on practical clinical problems that are frequently encountered in stroke rehabilitation. Consequences of diseases e.g. impairments and activity limitations are addressed in rehabilitation with the overall goal to reduce disability and promote participation. Based on the available best external evidence, clinical pathways are described for stroke rehabilitation, bridging the gap between clinical evidence and clinical decision making. The clinical pathways answer the questions which rehabilitation treatment options are beneficial to overcome specific impairment constellations and activity limitations and are well acceptable to stroke survivors as well as when and in which settings to provide rehabilitation over the course of recovery post stroke. Each chapter starts with a description of the clinical problem encountered. This is followed by a systematic but concise review of the evidence: RCTs, systematic reviews and meta-analyses that is relevant for clinical decision making and comments on assessment, therapy, training, technology, medication and the use of technical aids as appropriate. Based on these summaries, clinical algorithms/pathways are provided and the main clinical decision situations are portrayed. The book is invaluable for all neurorehabilitation team members: clinicians, nurses and therapists in neurology, physical medicine and rehabilitation and related fields. It is a World Federation for NeuroRehabilitation (WFNR) educational initiative bridging the gap between the rapidly expanding clinical research in stroke rehabilitation and clinical practice across societies and continents. It can be used for both clinical decision making for individuals and as well as clinical background knowledge for stroke rehabilitation service development initiatives.

Disability and Motor Behavior Ali S. Brian, Pamela S. Beach, 2023-10-27

Disability and Motor Behavior A Handbook of Research provides the first focused review of research and scholarship pertaining to individuals with disabilities across motor behavior related disciplines e.g. motor learning motor control motor development The book consists of 15 chapters that highlight current research trends future research directions and practical implications spanning different types of disability The book takes a holistic view toward motor behavior among persons with

disabilities from an empirical perspective This book is written at a level appropriate for graduate students and researchers and will be the first book to provide in depth discussions about research and scholarship across motor behavior Exercise training and testing in patients with heart failure Charlotta Lans, 2020-12-15 Patients with heart failure HF suffer from symptoms such as dyspnea fatigue and reduced quality of life which affect their physical function and often lead to immobilization and poor survival prognosis Exercise training in cardiac rehabilitation should be offered to every patient with HF and can be performed both in a hospital setting and with a home training programme Exercise in patients with HF improves physical function and functional capacity as well as health related quality of life HRQoL and reduces the need for hospital care There are several barriers against participating in exercise based cardiac rehabilitation despite information about its benefits The patient may anticipate not being able to exercise that the exercise would be too hard lives far away or has not been referred Aim The aim of this thesis was to evaluate the effects of exercise in heart failure patients of a one year training programme with hospital based training followed by a home based setting or only home based with special emphasis on peripheral muscle training PMT Furthermore to study frequently used methods for evaluation of the effects i e the 6 minute walk test and instruments for estimating health related quality of life Methods and findings In study I PMT was evaluated and the PMT programme in a hospital setting with equipment and subsequent homebased training with elastic bands was compared with solely home based training over 1 year At follow up every third month duplicated six minute walk test 6MWT and two HRQoL questionnaires were used The walking distance increased significantly after three months in both groups and was maintained thereafter Also HRQoL increased but at different time points In study II PMT was compared with interval training on an ergometer bike free walking Both groups started under supervision of a physiotherapist in a hospital setting for three months and thereafter at home for nine months The same measurements were used as in study I Neither walking distance nor HRQoL changed over the study period However this may be regarded as a positive effect in the light of the known progressive nature of heart failure In study III the 6MWTs from study I and II were used to evaluate the necessity of performing duplicated 6MWTs in follow ups clinically and for research purposes We found that it is sufficient to perform one 6MWT In study IV both 6MWT and HRQoL forms from study I and II were used to investigate the relationship between walking distance and perceived HRQoL in HF patients Patients with shorter walking distance than the group median experienced poorer general HRQoL but not HRQoL related to HF than the higher performing half of the study group There were no longitudinal trends in these relationships Conclusion PMT can be used as an exercise modality in patients with HF both in hospital and at home and may be evaluated with a single 6MWT Shorter walking distance was related to a lower general HRQoL as judged by the patients but there was no significant relation between short walking distance and the HF related HRQoL Individualizing the training programme and methods and offering the choice of exercise modality and the possibility of exercising at home might be a way to increase adherence in cardiac rehabilitation Patienter med hj rtsvikt besv

ras av andfödhet och trötthet vilket påverkar deras fysiska funktion och ofta leder till immobilisering nedsatt livskvalitet och dålig prognos. Träning inom hjärtrehabilitering bör erbjudas alla patienter med hjärtsvikt och kan utföras såväl på sjukhus som hemma med hemträningsprogram. Träning vid hjärtsvikt förbättrar fysisk funktion och funktionell kapacitet och relaterad livskvalitet och minskar behovet av vård på sjukhus. Det finns många barriärer till att delta i hjärtrehabilitering trots information om vinster, exempelvis att patienten tror sig inte klara av att träna, bör långa intervaller har inte fått remiss från att nämnas. Syfte: Syftet med avhandlingen var att utvärdera effekterna av ett träningsprogram för patienter med hjärtsvikt under 1 år, träning på sjukhus följt av hemträning eller enbart hemträning. Ett specifikt syfte var att utvärdera perifer muskelträning (PMT) som en möjlig lämplig träningsmetod för hjärtsviktpatienter. Vidare var syftet att utvärdera effekten av sex minuters gångtest och relaterad livskvalitet. Metod och resultat: I studie I utvärderades PMT och jämfördes träning på sjukhus med redskap med efterföljande hemträning med elastiska band med enbart hemträning under 1 år. Vid utvärdering var tredje månad användes dubbla sex minuters gångtest och frågeformulär om livskvalitet. Gångsträcka kade signifikant efter träning och höll i sig hela träningsperioden i båda grupperna. Livskvaliteten kade men vid olika tidpunkter. I studie II jämfördes PMT med intervallträning på ergometercykel, promenader. Båda grupperna tränade under ledning av fysioterapeut i tre månader och därefter hemma upp till 1 år. Samma utvärdering som i studie I. Gångsträcka och livskvaliteten ökade sig inte under studietiden. Det kan dock ses som en positiv effekt eftersom hjärtsviktpatienter vanligen försämrats över tid. I studie III användes gångtesten från studie I och II för att utvärdera om det rådde tvivel om dubbla sex minuters gångtest vid utvärdering. Ingen kliniskt betydelsefull skillnad sågs mellan gångtest ett och två. I studie IV användes både gångtest och livskvalitetsformulär från studie I och II för att undersöka samband mellan gångsträcka och upplevd livskvalitet och om detta samband ändrades med tiden. Patienter med kortare gångsträcka upplevde såväl som relaterad livskvalitet men inte livskvalitet relaterad till hjärtsvikten. Ingen kliniskt signifikant förändring över tid kunde inte påvisas. Konklusion: Perifer muskelträning kan användas som en säker träningsform för patienter med hjärtsvikt både på sjukhus och som hemträning och kan utvärderas med endast ett sex minuters gångtest. Patienter med kortare gångsträcka upplever såväl som livskvalitet vilket faller relativt oberoende av de olika testtidpunkterna.
