

URINARY SYSTEM

INTRODUCTION

- The urinary system excretes metabolic waste. While forming and eliminating urine, it also regulates the composition, volume, and acid-base balance (pH) of body fluids.

✚ In several ways, kidney activity affects circulation and blood pressure.

- The urinary system is thus of critical importance in maintaining **HOMEOSTASIS**, the state of internal balance.

THE URINARY SYSTEM CONSISTS OF:

1. Two **KIDNEYS**, the organs that form urine
2. Two **URETERS**, which transport urine from the kidneys to the bladder.
3. The **URINARY BLADDER**, which stores and eliminates urine.
4. The **URETHRA**, which carries urine out of the body.

WHAT DOES THE URINARY SYSTEM DO FOR YOU?

- Maintain the proper balance of water, salt, electrolytes and acids in the body fluids by removing excess fluids or reabsorbing water as needed.

- Constantly filters blood to remove urea and other waste materials. **UREA** is from protein breakdown.

- Converts waste products & excess fluids to **URINE** for excretion.

✚ Plays a role in stimulating RBC production, regulating blood pressure

KIDNEY

- These organs that form urine from substances filtered out of the blood. In addition to metabolic wastes urine contains water and ions, so its formation is important in **REGULATING THE BLOOD'S VOLUME AND COMPOSITION**.

- In addition, the kidneys produce two substances that act on the circulatory system:

1 **ERYTHROPOIETIN (EPO)**, a hormone that stimulates red blood cell production in the bone marrow.

2 **RENIN**, an enzyme that functions to raise blood pressure. It activates a blood component called **ANGIOTENSIN**, which causes constriction of the blood vessels.

- The drugs known as **ACE INHIBITORS** (angiotensin-converting enzyme inhibitors) lower blood pressure by interfering with the production of angiotensin.

KIDNEYS LOCATION AND STRUCTURE

- The kidneys are located behind the peritoneum in the lumbar region.

- On the top of each kidney rests an **ADRENAL GLAND**.

- The kidney is encased in a capsule of fibrous connective tissue overlaid with fat.

- An outermost layer of connective tissue supports the kidney and anchors it to the body wall.
